DLPS047B-SEPTEMBER 2014-REVISED OCTOBER 2015

## DLPA2005 Power Management and LED/Lamp Driver IC

Technical

Documents

#### 1 Features

- High Efficiency RGB LED/Lamp Driver With Buck-Boost DC-to-DC Converter, DMD Supplies, DPP Core Supply, 1.8-V Load Switch, and Measurement System in a Small Chip-Scale Package
- Three Low-Impedance (30 mΩ Typical at 27°C) **MOSFET Switches for Channel Selection**
- Independent, 10-Bit Current Control per Channel
- 2.4-A Max LED Current for DLPA2005 Embedded Applications
- **DMD** Regulators
  - Requires Only a Single Inductor
  - VOFS: 10 V \_
  - VBIAS: 18 V
  - VRST: –14 V
  - Passive Discharge to GND When Disabled
- DPP 1.1-V Core Supply
  - Synchronous Step-Down Converter With Integrated Switching FETs
  - Supports up to 600-mA Output Current
- VLED Buck Boost Converter
  - Power Save Mode at Light Load Current
- Low-Impedance Load Switch
  - V<sub>IN</sub> Range from 1.8 to 3.6 V
  - Supports up to 200 mA of Current
  - Passive Discharge to GND When Disabled
- DMD Reset Signal Generation and Power Supply Sequencing
- 33-MHz Serial Peripheral Interface (SPI)
- Multiplexer for Measuring Analog Signals
  - Battery Voltage
  - LED Voltage, LED Current

- Light Sensor (for White Point Correction)
- Internal Reference Voltage
- External (Thermistor) Temperature Sensor
- Monitoring and Protection Circuits
  - Hot Die Warning and Thermal
  - Low-Battery Warning

Tools &

Software

- Programmable Battery Undervoltage Lockout (UVLO)
- Load Switch UVLO
- Overcurrent and Undervoltage Protection
- DLPA2005 QFN Package
  - 48-Pin 0.4-mm Pitch
  - Die Size: 6.0 mm × 6.0 mm ± 0.15 mm

## 2 Applications

DLP<sup>®</sup> Pico<sup>™</sup> Projector DLP<sup>®</sup> Mobile Sensing

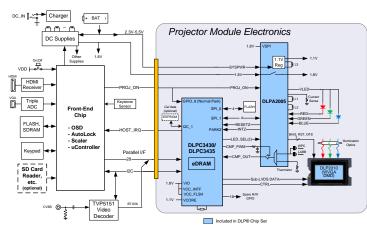

## **3** Description

DLPA2005 is a dedicated PMIC/RGB LED/Lamp driver for the DLP2010, DLP2010NIR and DLP3010 Digital Micromirror Devices (DMD) when used with a DLPC3430, DLPC3433, DLPC3435, DLCP3438, or DLPC150 digital controller. For reliable operation of these chipsets it is mandatory to use a DLPA2000 or DLPA2005.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)		
DLPA2005	VQFN (48)	6.00 mm × 6.00 mm ± 0.150 mm		

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## **4** Revision History

С	hanges from Revision A (September 2014) to Revision B	Page
•	Updated title	1
•	Updated Features, Applications, and Description	1
•	Added mobile sensing application	1
•	Updated Detailed Description	12
•	Added new Typical Mobile Sensing application in Application Information	38

## Changes from Original (August 2014) to Revision A

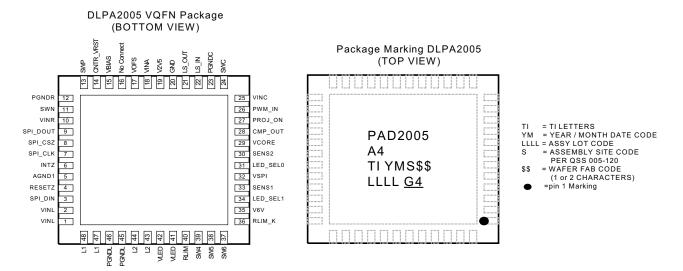

•	Changed device status from Product preview to Production Data and released full version of the document	1

## 5 Pin Configuration and Functions

PI	IN					
NAME	NUMBER	I/O	DESCRIPTION			
	1					
VINL 2		- 1	Power supply input for VLED BUCK-BOOST power stage. Connect to system power.			
SPI_DIN	3	I	SPI data input			
RESETZ	4	0	Reset output to the DLP system (active low). Pin is held low to reset DLP system.			
AGND1	5	GND	Analog ground. Connect to ground plane.			
INTZ	6	0	Interrupt output signal (open drain). Connect to pullup resistor or short to ground.			
SPI_CLK	7	I	Clock input for SPI interface			
SPI_CSZ	8	I	SPI chip select (active low)			
SPI_DOUT	9	0	SPI data output			
VINR	10	I	Power supply input for DMD switch mode power supply (SMPS). Connect to system power.			
SWN	11	I	Connection for the DMD SMPS-inductor (high-side switch).			
PGNDR	12	GND	Power ground for DMD SMPS. Connect to ground plane.			
SWP	13	0	Connection for the DMD SMPS-inductor (low-side switch).			
CNTR_VRST	14	0	Connection to VRST for fast discharge function			
VBIAS	15	0	VBIAS output rail. Connect to ceramic capacitor.			
No Connect	16	I	Previously reference pin for the VRST regulator. On A4 design this reference is internal to DLPA2005 chip.			
VOFS	17	0	VOFS output rail. Connect to ceramic capacitor.			
VINA	18	POWER	Power supply input for sensitive analog circuitry			
V2V5	19	0	Internal supply filter pin for digital logic; typical 2.5 V			
GND	20	GND	Ground connection to be connected to ground plane.			
LS_OUT	21	0	Load switch			
LS_IN	22	I	Load switch			
PGNDC	23	GND	Power ground for VCORE BUCK			
SWC	24	I/0	Connection for 1.1-V BUCK inductor			
VINC	25	I	Power supply input for VCORE BUCK power stage. Connect to system power.			
PWM_IN	26	I	Reference voltage input for analog comparator.			
PROJ_ON	27	I	Input signal to enable or disable the IC and DLP projector.			

#### **Pin Functions**

DLPA2005 DLPS047B – SEPTEMBER 2014 – REVISED OCTOBER 2015

NSTRUMENTS

**EXAS** 

## Pin Functions (continued)

P	NIN	1/0	DESCRIPTION		
NAME	NUMBER	I/O	DESCRIPTION		
CMP_OUT	28	0	Analog-comparator output.		
VCORE	29	I	VCORE BUCK converter feedback pin.		
SENS2	30	I	Input signal from temperature sensor.		
LED_SEL0	31	I	Digital input to the RGB Strobe Decoder		
VSPI	32	I	Power supply input for SPI interface. Connect to system I/O voltage.		
SENS1	33	I	Input signal from light sensor.		
LED_SEL1	34	I	Digital input to the RGB Strobe Decoder		
V6V	35	0	ernal supply filter pin for gate driver circuitry. Typical 6.25 V		
RLIM_K	36	I	Kelvin sense connection to top side of LED current sense resistor. For best accuracy, route this trace directly to the top of the current sense resistor and reparate it from the normal trace from the current sense resistor to the RLIM pins.		
SW6	37	0	Low-side MOSFET switch for LED cathode. Connect to RGB LED assembly.		
SW5	38	0	Low-side MOSFET switch for LED cathode. Connect to RGB LED assembly.		
SW4	39	0	Low-side MOSFET switch for LED cathode. Connect to RGB LED assembly.		
RLIM	40	0	Connection to LED 'current sense' resistor. Bottom side of sense resistor is connected to GND.		
VLED	41 / 42	0	VLED BUCK-BOOST converter output pin.		
L2	43 / 44	I	Connection for VLED BUCK-BOOST inductor.		
PGNDL	45 / 46	GND	Power ground for VLED BUCK-BOOST. Connect to ground plane.		
L1	47 / 48	0	Connection for VLED BUCK-BOOST inductor.		

# DLPS047B – SEPTEMBER 2014 – REVISED OCTOBER 2015

## 6 Specifications

#### 6.1 Absolute Maximum Ratings

Over operating free-air temperature (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
	Input voltage at VINL, VINA, VINR, VINC	-0.3	7	V
	Ground pins to system ground	-0.3	0.3	V
	Voltage at SWN	-18	7	V
	Voltage at SWP, VBIAS	-0.3	20	V
	Voltage at VOFS	-0.3	12	V
	Voltage at V6V, VLED, L1, L2, SWC, SW4, SW5, SW6, INTZ, PROJ_ON	-0.3	7	V
	Voltage at all pins, unless noted otherwise	-0.3	3.6	V
	Source current RESETZ, CMP_OUT		1	mA
	Source current SPI_DOUT		5.5	mA
	Sink current RESETZ, CMP_OUT		1	mA
	Sink current SPI_DOUT, INTZ		5.5	mA
	Peak output current	Internally	y limited	
	Continuous total power dissipation	Internally limit shute		
TJ	Operating junction temperature	-30	150	°C
T <sup>stg</sup>	Storage temperature	65	150	°C

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

#### 6.2 ESD Ratings

			VALUE	UNIT
		Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	±2000	
V <sub>(ESD)</sub>	Electrostatic discharge	Charged device model (CDM), per JEDEC specification JESD22-C101, all $\ensuremath{\text{pins}^{(2)}}$	±500	V

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

## 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted).

		MIN	NOM	MAX	UNIT
Input voltage at VINL, VINA,	Full functional and parametric performance	2.7	3.6	6	V
VINR, VINČ,	Extended operating range, limited parametric performance	2.3	3.6	6	
Voltage at VSPI		1.65	1.8	3.6	V
Operational ambient temperature		-10		85	°C
Operational junction temperature		-10		120	°C

## 6.4 Thermal Information

	THERMAL METRIC <sup>(1)</sup>	DLPA2005	UNIT	
		RSL (48 PINS)	UNIT	
$R_{\theta J A}$	Junction-to-ambient thermal resistance <sup>(2)</sup>	27.9	°C/W	

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, SPRA953.

(2) Estimated when mounted on high K JEDEC board per JESD 51-7 with thickness of 1.6 mm, 4 layers, size of 76.2 mm × 114.3 mm, and 2-oz. copper for top and bottom plane. Actual thermal impedance will depend on PCB used in the application. DLPS047B-SEPTEMBER 2014-REVISED OCTOBER 2015

#### 6.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted) (see  $^{(1)(2)(3)}$ )

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
SUPPLIES						
INPUT VOLT	AGE					
M	Input voltage range		2.7	3.6	6	V
V <sub>IN</sub>	Extended input voltage range <sup>(1)</sup>	VINA, VINR, VINL, VINC	2.3	3.6	6	V
M	Low-battery warning threshold	V <sub>INA</sub> falling		3		V
V <sub>LOW_BAT</sub>	Hysteresis	V <sub>INA</sub> rising		100		mV
N/	Undervoltage lockout threshold	V <sub>INA</sub> falling (through 5-bit trim function)	2.3		4.5	V
V <sub>hys(UVLO)</sub>	Hysteresis	V <sub>INA</sub> rising		100		mV
V <sub>STARTUP</sub>	Startup voltage	VBIAS, VOFS, VRST; loaded with 2 mA	2.5			V
INPUT CURR	ENT					
lq	ACTIVE mode	Motor current excluded		15		mA
I <sub>STD</sub>	STANDBY mode			900		μA
I <sub>IDLE</sub>	IDLE mode			10		μA
INTERNAL S	UPPLIES	·				
V <sub>V6V</sub>	Internal supply, analog			6.25		V
C <sub>LDO_V6V</sub>	Filter capacitor for V6V LDO			100		nF
V <sub>V2V5</sub>	Internal supply, logic			2.5		V
C <sub>LDO_V2V5</sub>	Filter capacitor for V2V5 LDO			2.2		μF
DMD REGUL	ATOR				1	
_	MOSFET ON-resistance	Switch E (from VINR to SWN)		1000		•
R <sub>DS(ON)</sub>		Switch F (from SWP to PGNDR)		320		mΩ
		Switch $G^{(2)}$ (from SWP to VBIAS[2]) V <sub>INR</sub> = 5 V, V <sub>SWP</sub> = 2 V, I <sub>F</sub> = 100 mA		1.3		
V <sub>FW</sub>	Forward voltage drop	Switch H (from SWP to VOFS) $V_{INR} = 5 V$ , $V_{SWP} = 2 V$ , $I_F = 100 mA$		1.3		V
t <sub>DIS</sub>	Rail discharge time	$V_{IN} = 2.9 \text{ V}; C_{OUT} = 110 \text{ nF}$			40	μs
t <sub>PG</sub>	Power-good timeout	Not tested in production		6		ms
I <sub>LIMIT</sub>	Switch current limit			312		mA
L	Inductor value			10		μΗ
VOFS REGU						P
	Output voltage			10		V
	DC output voltage accuracy	I <sub>OUT</sub> = 2 mA	-2%		2%	
V <sub>OFS</sub>	DC load regulation	$V_{IN} = 3.6 \text{ V}, I_{OUT} = 0 \text{ to } 2 \text{ mA}$		-19		V/A
	DC line regulation	VINA, VINL, VINR, VINC 2.7 to 6 V, I <sub>OUT</sub> = 2 mA		35		mV/V
V <sub>RIPPLE</sub>	Output ripple	$V_{IN} = 3.6 \text{ V}, I_{OUT} = 2 \text{ mA}, C_{OUT} = 440 \text{ nF}^{(4)}$		375		mVpp
I <sub>OUT</sub>	Output current		0		3	mA
	Power-good threshold	V <sub>OFS</sub> rising		86%		
PG	(fraction of nominal output voltage)	V <sub>OFS</sub> falling		66%		
R <sub>DIS</sub>	Output discharge resistor	Active when rail is disabled		100		Ω
		Recommended value (output capacitors for VOFS / VBIAS must be equal)	110	220		nF
C <sub>OUT</sub>	Output capacitor	t <sub>DISCHARGE</sub> < 40 µs at 2.9 V	100		110	nF

Fully functional but limited parametric performance (1)

Including rectifying diode Typicals are at 25 C.

(2) (3) (4)

To reduce ripple the  $C_{\text{OUT}}$  can be increased.  $V_{\text{RIPPLE}}$  is inversely proportional to  $C_{\text{OUT}}.$ 

## **Electrical Characteristics (continued)**

over operating free-air temperature range (unless otherwise noted) (see  $^{(1)(2)(3)}$ )

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
VBIAS REGU	ILATOR					
	Output voltage			18		V

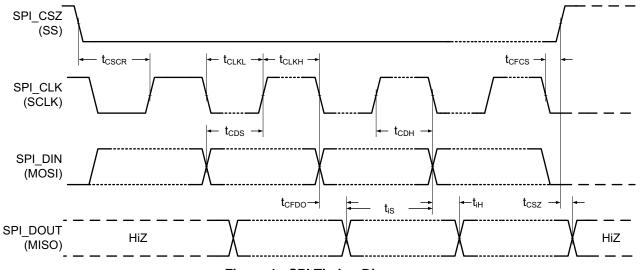

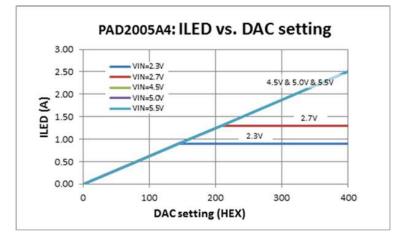

Figure 1. SPI Timing Diagram

#### 6.7 Typical Characteristics

The maximum output current of the buck-boost is a function of input voltage (VIN), and output voltage (VLED). The relationship between VIN, VLED, and MAX ILED is shown in Figure 2. Please note that VLED is the output of the buck-boost regulator, which includes the voltage drop across the sense resistor RLIM (39 mOhms typical), internal strobe control switch (75 m $\Omega$  max), and the forward voltage of the LED. For example, to drive 2.4 A of current through a LED with Vf = 4.8 V using the DLPA2005, the minimum input voltage needs to be 4.5 V.

2.3 V < VLED < 4.8 V

#### Figure 2. Maximum LED Output Current as a Function of Input Voltage (VIN) and Buck-Boost Output Voltage (VLED)

#### NOTE

Measured on a typical unit. VLED is the output of the buck-boost regulator and includes the voltage drop across the sense resistor, internal strobe control switch, and the forward voltage of the LED.

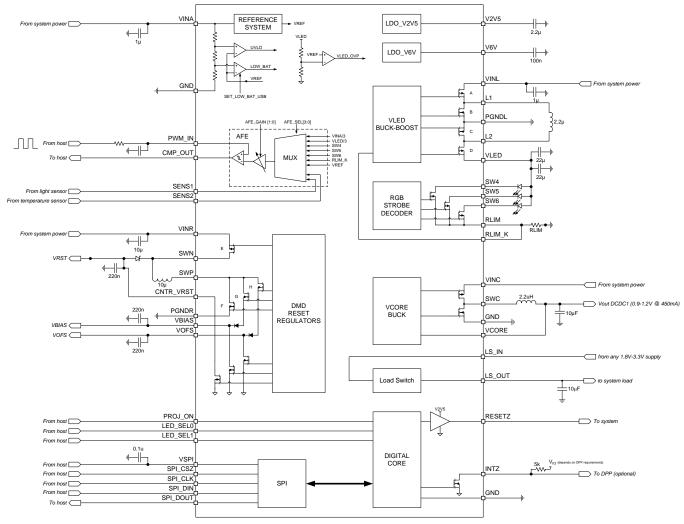

## 7 Detailed Description

#### 7.1 Overview

The DLPA2005 is a power management and LED driver IC optimized for DLP video and data display systems. DLPA2005 is part of the chipset comprising of either DLP2010 (.2WVGA) DMD and DLPC3430/DLPC3435 controller, the DLP2010NIR (.2WVGA-NIR) DMD and DLPC150 controller, or the DLP3010 (.3 720p) DMD and DLPC3433/DLPC3438 controller. The DLPA2005 contains a complete LED driver including high efficiency power convertors. The DLPA2005 can supply up to 2.4 A per LED. Integrated high-current switches are included for sequentially selecting R, G, and B LEDs. The DLPA2005 also contains three regulated DC supplies for the DMD reset circuitry: VBIAS, VRST and VOFS, as well as a regulated DC supply of 1.1 V and a load switch for the 1.8 V to support the controllers. The DLPA2005 has a SPI used for setting the configuration. Using SPI, currents can be set independently for each LED with 10-bit resolution. Other features included are the generation of the system reset, power sequencing, input signals for sequentially selecting the active LED, IC self-protections, and an analog MUX for routing analog information to an external ADC.

## 7.2 Functional Block Diagram

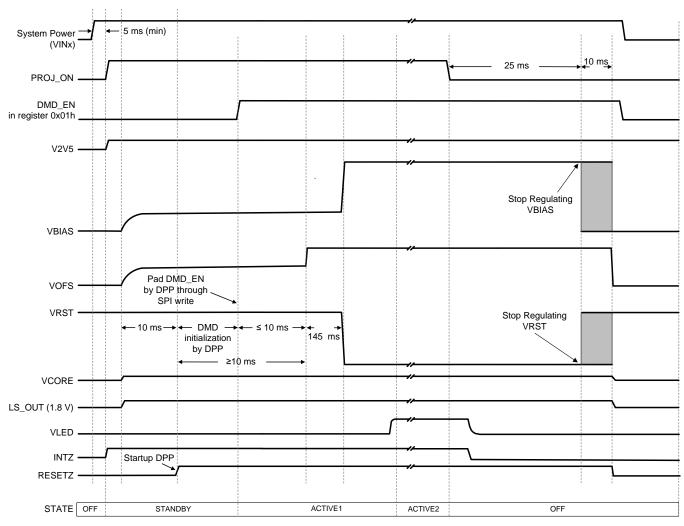

- A. Pin names refer to DLPA2005 pinout
- B. Pins connected to 'system power' can be locally decoupled with the capacity as indicated in the block diagram. At least adequate decoupling capacity (50 µF or more) should be connected at the location the supply is entering the board.

#### 7.3 Feature Description

#### 7.3.1 DMD Regulators

DLPA2005 contains three switch-mode power supplies that power the DMD. These rails are VOFS, VBIAS, and VRST. After pulling the PROJ\_ON pin high, the DMD is first initialized followed by a power-up of the VOFS line after a small delay of less than 10 ms followed by VBIAS and VRST with an additional delay of 145 ms. The LED driver and STROBE DECODER circuit can only be enabled after all three rails are enabled. There are two power-down sequences, the normal power-down timing initiated after pulling the PROJ\_ON pin low, and a fast power-down mode where if any one of the rails encounters a fault such as an output short, all three rails are discharged simultaneously. The detailed power-up and power-down diagrams are shown in Figure 3 and Figure 4.

#### NOTE

All values are typical (unless otherwise noted).

## Feature Description (continued)

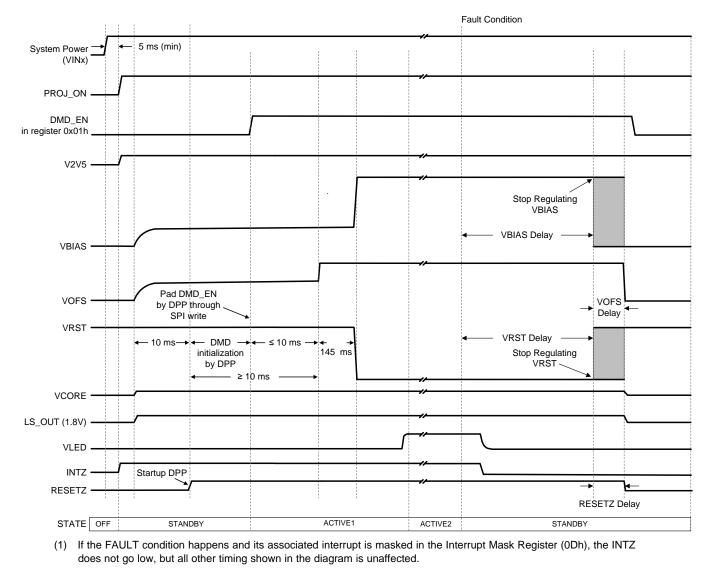

Figure 4. Power Sequence Fault Shutdown Mode

NOTE

All values are typical (unless otherwise noted).

#### 7.3.2 RGB Strobe Decoder

DLPA2005 contains RGB color-sequential circuitry that is composed of three NMOS switches, the LED driver, the strobe decoder, and the LED current control. The NMOS switches are connected to the terminals of the external LED package and turn the currents through the LEDs on and off. Package connections are shown in Figure 5 and Figure 9 and corresponding switch map in Table 1.

The LED\_SEL[1:0] signals typically receive a rotating code switching from RED to GREEN to BLUE and then back to RED. When the LED\_SEL[1:0] input signals select a specific color, the NMOSFETs are controlled based on the color selected, and a 10-bit current control DAC for this color is selected that provides a control current to the RGB LEDs feedback control network.

## Feature Description (continued)

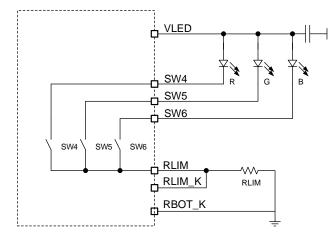

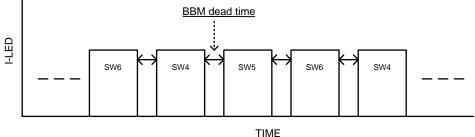

Figure 5. Switch Connection for a Common-Anode LED Assembly

Common Anode						
LED_SEL[1:0]	SW6	SW5	SW4	IDAC Input		
0x00h	Open	Open	Open	N/A		
0x01h	Open	Open	Closed	SW4_IDAC[9:0]		
0x02h	Open	Closed	Open	SW5_IDAC[9:0]		
0x03h	Closed	Open	Open	SW6_IDAC[9:0]		

The switching of the three NMOS switches is controlled such that switches are returned to the open position first before the closed connections are made (break before make). The dead time between opening and closing switches is controlled through the BBM register. Switches that already are in the closed position (and are to remain in the closed state according to the SWCNTRL register) are not opened during the BBM delay time.

TIME

Figure 6. BBM Timing (See Register 0Bh in Table 20)

#### 7.3.3 LED Current Control

DLPA2005 provides time-sequential circuitry to drive three LEDs with independent current control. A system based on a common anode LED configuration is shown in Figure 9 and consists of a buck-boost converter, which provides the voltage to drive the LEDs, three switches connected to the cathodes of the LEDs, an RLIM resistor used to sense the LED current, and a current DAC to control the LED current. The voltage measured at the pin V(RLIM\_K) is used by the regulator loop.

The STROBE DECODER controls the switch positions as described in the previous section (*RGB Strobe Decoder*). With all switches in the open position, the buck-boost output assumes an output voltage of 3.5 V.

Copyright © 2014–2015, Texas Instruments Incorporated

For a common-anode RGB LED configuration, the buck-boost output voltage (VLED) assumes a value such that the voltage drop across the sense resistor equals

when SW4 is closed. The exact value of VLED depends on the current setting and the voltage drop across the LED but is limited to 5.4 V. When the STROBE decoder switches from SW4 to SW5, the buck-boost assumes a new output voltage such that the sense voltage equals:

(SW5\_IDAC[9:0]Ivalue + ILED) × RLIM

and finally when SW6 is selected.

(SW6\_IDAC[9:0]Ivalue + ILED) × RLIM

#### 7.3.4 Maximum Led Currents and Efficiency Considerations

The DLPA2005 comprises a buck-boost power converter to supply the appropriate VLED to the LEDs. The maximum obtainable LED current for a given LED forward voltage are limited by three items:

- The inherent maximum LED current of the PAD2005, i.e. for DAC setting 03FFh.
- The maximum input current of about 4 A.
- The converter efficiency.
- Junction and ambient temperature

In the Figure 2 graph the LED current versus DAC setting is given for several supply voltages (VIN). The load was configured for each supply case such that at the maximum attainable current VOUT max=4.8 V.

For the higher supply voltages VIN>4.5 V the DAC current increases linearly up to the max setting of 3FFh. At that setting the ILED is about 2.5 A. For VIN=2.3 V and VIN=2.7 V the LED current is typically limited to 0.9 A and 1.3 A, respectively. Main reason of this limitation is the maximum input current in combination with the limited converter efficiency. This can be understood by looking at the equation describing the power conversion:

$$V_{OUT} \cdot I_{OUT} = \eta_{eff} \cdot V_{IN} \cdot I_{IN}$$

This equation states that the output power of the converter is equal to the input power times the converter efficiency. As indicated above, the input current IIN of the power converter is maximized to about 4A. The  $n_{eff}$  is the efficiency of the power converter, as described further down this section. For the lower input voltage the power converter runs as a boost converter.

(VOUT=4.8 V). Assuming 100% efficiency, VIN=2.3 V, VOUT=4.8 V and IINmax=4 A, the maximum attainable ILED is:

$$I_{LED} = \frac{\eta_{eff} \cdot V_{IN} \cdot I_{IN}}{V_{OUT}} = \frac{1 \cdot 2.3V \cdot 4A}{4.8V} = 1.9A$$

For the power converter approaching the maximum input current, the efficiency can roll down significantly. As a result the maximum LED current for VIN=2.3 V and VOUT=4.8 V is about 0.9 A.

The efficiency of the power converter depends on the input supply voltage and the output loading, i.e. output voltage and output current. In the below graph efficiency curves as a function of the LED current are given for several input supply voltages. Again for each of these supply cases the load was controlled such that at maximum output current the output voltage was about 4.8 V.

(3)

FXAS

NSTRUMENTS

## Figure 7. Measured Typical Power converter efficiency as a function of ILED for several supply voltages (VOUTmax=4.8V for each supply)

Note that in the measurement the output of the buck-boost regulator includes the voltage drop across the sense resistor RLIM, the voltage drop across the internal strobe control switch, and the forward voltage of the LED.

For higher input voltages the power converter runs at an efficiency of 85% or better. For the lower supply voltages because of the boost action, the efficiency quickly rolls down. Refer to section Thermal Considerations for information related to these efficiencies.

#### 7.3.5 Calculating Inductor Peak Current

To properly configure the DLPA2005 device, a 2.2-µH inductor must be connected between pin L1 and pin L2. The peak current for the inductor in steady state operation can be calculated.

Equation 4 shows how to calculate the peak current  $I_1$  in step down mode operation, and Equation 5 shows how to calculate the peak current  $I_2$  in boost mode operation.  $V_{IN1}$  is the maximum input voltage,  $V_{IN2}$  is the minimum input voltage, *f* is the switching frequency (2.25 MHz), and L the inductor value (2.2  $\mu$ H).

$$I_{1} = \frac{I_{OUT}}{0.8} + \frac{V_{OUT} (V_{IN1} - V_{OUT})}{2 \times V_{IN1} \times f \times L}$$

$$I_{2} = \frac{V_{OUT} \times I_{OUT}}{0.8 \times V_{IN2}} + \frac{V_{IN2} (V_{OUT} - V_{IN2})}{2 \times V_{OUT} \times f \times L}$$

$$(4)$$

The critical current value for selecting the right inductor is the higher value of  $I_1$  and  $I_2$ . Also consider that load transients and error conditions may cause higher inductor currents. This needs to be accounted for when selecting an appropriate inductor. Internally the switching current is limited to a maximum of 4 A.

Copyright © 2014–2015, Texas Instruments Incorporated

#### 7.3.6 LED Current Accuracy

The LED drive current is controlled by a current DAC (Digital to Analog Converter) and can be set independently for switch SW4, SW5 and SW6. For the DLPA2005, the DAC is trimmed at a current of 2528 mA at code: 0x3FFh, and the step size is 2.47 mA. First order gain-error of the DAC can be neglected, but an offset current error must be taken into account. This offset error differs depending on the used RLIM, and is ±100 mA for the DLPA2005 using a current sense resistor of 39 m $\Omega$ .

The max current of the DLPA2005 (SWx\_IDAC[9:0] = 0x3FFh) is regulated to 2528 mA. At the lowest setting (SWx\_IDAC[9:0] = 0x029h) the current is regulated to 101 mA (DLPA2005). For this current setting (0x028h), the absolute current error results into a large relative error, however this is not a typical operating point.

For best accuracy of the LED current, take the below two considerations into account:

- The LED current setting does not only depend on the accuracy of the RLIM resistor but also strongly depends on the added resistance of pcb traces in the ground route of RLIM and the soldering quality. Due to the low value of the current sense resistor RLIM, any extra introduced resistance of e.g. several milliohms will result in a noticeable different LED current.
- Voltage sensing across RLIM is internally referred to the analog ground, i.e. pin 5 AGND1 and pin 20 GND. To prevent any voltage drop between the ground connection of RLIM and the AGND of the PAD2005, make a star connection of the RLIM ground near pin 5. Take care to make it a low ohmic route that can handle the high LED current. Subsequently, make the ground connection for pin 5 to the system ground low ohmic as well.

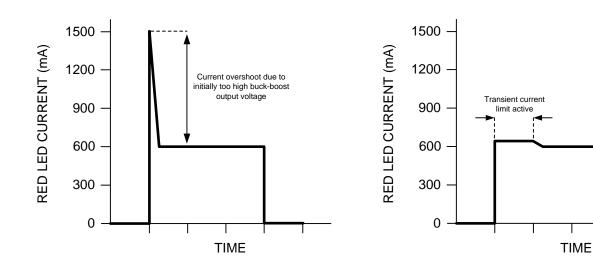

Taking the above measures relative to RLIM, the ILED current should align with the calculated value according to:

- Decimal\_Code# = (set\_current min\_current)/ step\_current.
- If needed translate the Decimal\_Code# to HEX code before entering in the control software.

#### 7.3.7 Transient Current Limiting

Typically the forward voltages of the green and blue diodes are close to each other (about 3 to 4 V). However, the forward voltage of the red diode is significantly lower (1.8 to 2.5 V). This can lead to a current spike in the red diode when the strobe controller switches from green or blue to red because VLED is initially at a higher voltage than required to drive the RED diode. DLPA2005 provides transient current limiting for each switch to limit the current in the LEDs during the transition. The transient current limit value is controlled through the ILIM[3:0] bits in the IREG register. The same register also contains three bits to select which switch employs the transient current limiting feature. In a typical application, the transient current limit will only apply to the RED diode, and the ILIM[3:0] value will typically be set approximately 10% higher than the DC regulation current. The effect that the transient current limit has on the LED current is shown in Figure 8.

Red LED current without transient current limit. The current overshoots because the buck-boost voltage starts at the (higher) level of the green or blue LED.

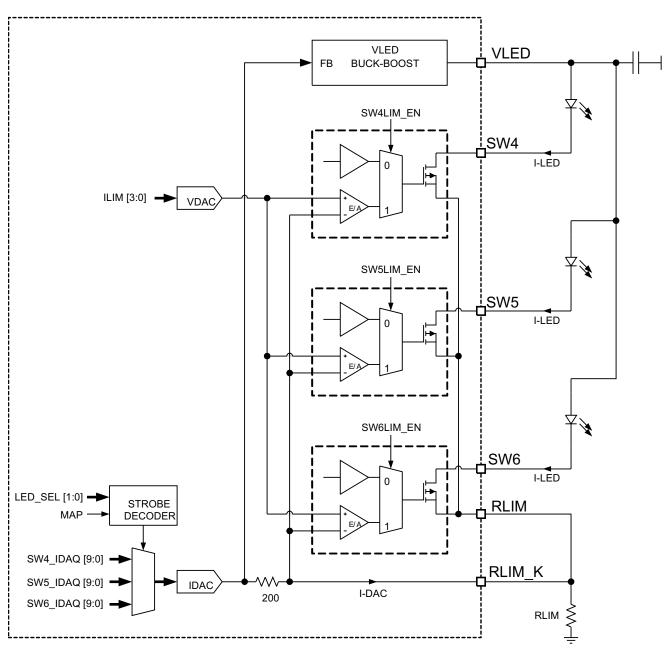

#### Figure 8. RED LED Current With and Without Transient Current Limit

DLPS047B-SEPTEMBER 2014-REVISED OCTOBER 2015

**DLPA2005** 

www.ti.com

#### 7.3.8 1.1-V Regulator (Buck Converter)

The buck converter creates a voltage of 1.1 V, and due to its switching nature, an output ripple with a frequency of approximately 2.25 MHz occurs on its output. This ripple is strongly dependent on the decoupling capacitor at the output in combination with the inductor. The magnitude of the ripple can be calculated with Equation 6.

$$\Delta V_{\text{CORE}} = V_{\text{CORE}} \times \frac{1 - \frac{V_{\text{CORE}}}{V_{\text{INC}}}}{L \times f} \times \left(\frac{1}{8 \times C_{\text{OUT}} \times f} + \text{ESR}\right)$$

The best way to minimize this ripple is to select a capacitor with a very-low ESR.

#### 7.3.9 Measurement System

The measurement system is composed of a 10:1 analog multiplexer (MUX), a programmable-gain amplifier, and a comparator. It works together with the DPP processor to provide:

- White-point correction (WPC) by independently adjusting the RGB LED currents after measuring the brightness of each color with an external light sensor
- A measurement of the:
- Battery voltage
- LED forward voltage
- Exact LED current
- Temperature as derived by measuring the voltage across an external thermistor

Figure 10 shows a block diagram of the measurement system.

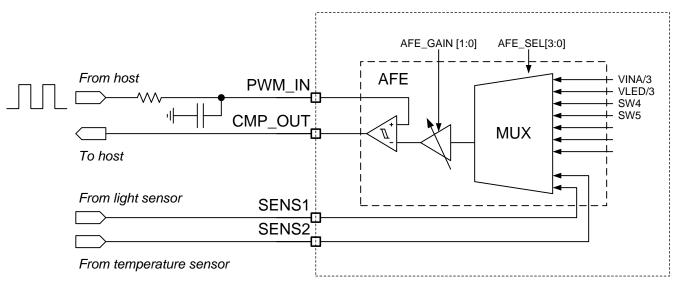

Figure 10. Block Diagram of the Measurement System

AFE_SEL[3:0]	SELECTED INPUT	RECOMMENDED GAIN SETTING AFE-GAIN[1:0]	RECOMMENDED SETTING OF AFE_CAL_DIS BIT

0x08h	No connect	N/A	N/A
0x09h	VREF	0x01h (1x)	Setting has no effect on measurement

#### 7.3.10 Protection Circuits

DLPA2005 has several protection circuits to protect the IC and system from damage due to excessive power consumption, die temperature, or over-voltages. These circuits are described in the following sections.

#### 7.3.10.1 Thermal Warning (HOT) and Thermal Shutdown (TSD)

DLPA2005 continuously monitors the junction temperature and issues a HOT interrupt if temperature exceeds the HOT threshold. If the temperature continues to increase above the thermal shutdown threshold, all rails are disabled and the TSD bit in the INT register is set. After the temperature drops below its threshold, the system recovers and waits for the DPP to resend the DMD\_EN bit.

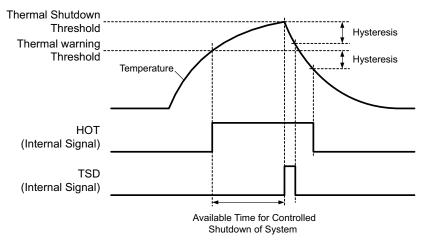

Figure 11. Definition of the Thermal Shutdown and Hot-Die Temperature Warning

#### 7.3.10.2 Low Battery Warning (BAT\_LOW) and Undervoltage Lockout (UVLO)

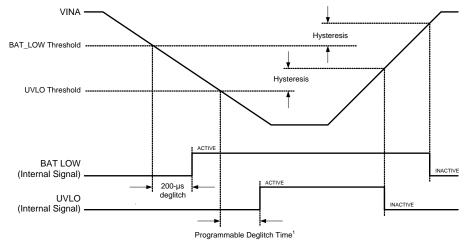

If the battery voltage drops below the BAT\_LOW threshold (typically 3 V) the BAT\_LOW interrupt is issued, but normal operation continues. After the battery drops below the undervoltage threshold which has a default hardcoded value of 2.3 V (this UVLO voltage can be changed through register 09 h from 2.3 to 4.5 V), the UVLO interrupt is issued, all rails are powered down in sequence, the DMD\_EN bit is reset, and the part enters STANDBY mode. The power rails cannot be re-enabled before the input voltage recovers to >2.4 V. To re-enable the rails, the PROJ\_ON pin must be toggled. The undervoltage threshold is programmable from 2.3 to 4.5 V in 31 steps.

The UVLO shutdown process will protect the DMD by allowing time for the mirrors to park, then doing a fast discharge of VOFS, VRST, and VBIAS. This protection occurs even in the case of sudden battery removal from the projector, as long as the bulk capacitance on the battery voltage (VINx) keeps this voltage above 2.3 V for as long as needed for VOFS, VRST, and VBIAS to discharge to the required safe levels as shown in the DMD data sheet. VOFS, VRST, and VBIAS discharge times depend on the load capacitance on each regulator. When for instance every supply is decoupled using a capacitor of 0.5  $\mu$ F, VINx should stay above 2.3 V for at least 100  $\mu$ s after the battery is suddenly removed. During this time, the mirrors can be placed in a safe position and VOFS, VRST, and VBIAS can be discharged.

#### NOTE

Capacitive loads should be such that LS\_OUT stays above 1.65 V until VOFS, VRST, and VBIAS have discharged to their required safe levels.

(1) This time is programmable from 0 to  $100 \ \mu s$ 

#### Figure 12. UVLO is Asserted When the Input Supply Drops Below the UVLO Threshold

#### 7.3.10.3 DMD Regulator Fault (DMD\_FLT)

The DMD regulator is continuously monitored to check if the output rails are in regulation and if the inductor current increases as expected during a switching cycle. If either one of the output rails drops out of regulation (for example, due to a shorted output) or the inductor current does not increase as expected during a switching cycle (due to a disconnected inductor), the DMD\_FLT interrupt bit is set in the INT register, the DMD\_EN bit is reset, and the DMD regulator is shut down. Resetting the DMD\_EN bit also causes the LED driver to power down. To restart the system, the PROJ\_ON pin must be toggled. In case the interrupt is masked, it is sufficient to set the DMD\_EN bit to restart the system.

#### 7.3.10.4 V6V Power-Good (V6V\_PGF) Fault

The LED driver regulation loop requires the V6V rail for proper operation. The rail is continuously monitored and should the output drop below the power-good threshold, the V6V\_PGF bit is set. The VLED buck-boost is then disabled and attempts to restart automatically.

#### 7.3.10.5 VLED Overvoltage (VLED\_OVP) Fault

If the buck-boost output voltage rises above 5.4 V, the VLED\_OVP interrupt is set but the buck-boost regulator is not turned off. A typical condition to cause this fault is an open LED.

#### 7.3.10.6 VLED Power Save Mode

In normal PWM operation, the efficiency of the VLED buck-boost converter dramatically reduces for LED currents below 100 mA. In this case, the power save mode allows high converting efficiency at low output currents by skipping pulses in the switcher's gate driver control.

#### 7.3.10.7 V1V8 PG Failure

If for any reason the voltage on the LS\_OUT drops below approximately 1.3 V, then VOFS, VBIAS, and VRST immediately go into fast shut down. Holding off power down to do mirror parking is not included since 1.3 V is too low to wait for this. Reactivating can only be done by toggling the PROJ\_ON off and on again.

#### 7.3.10.8 Interrupt Pin (INTZ)

Use the interrupt pin to signal events and fault conditions to the host processor. Whenever a fault or event occurs in the IC, the corresponding interrupt bit is set in the INT register, and the open-drain output is pulled low. The INTZ pin is released (returns to HiZ state) and fault bits are cleared when the INT register is read by the host.

However, if a failure persists, the corresponding INT bit remains set and the INTZ pin is pulled low again after a maximum of 32 µs.

Copyright © 2014–2015, Texas Instruments Incorporated

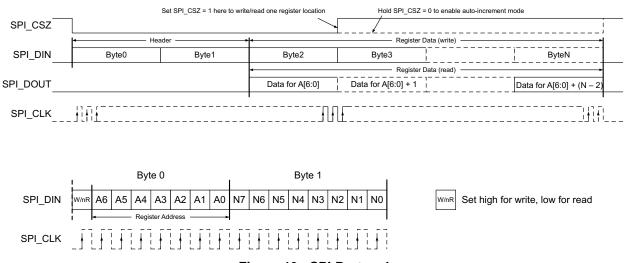

Interrupt events include fault conditions such as power-good faults, over-voltage, over-temperature shutdown, and UVLO. For all interrupt conditions see the interrupt register on Table 22.

The MASK register is used to mask events from generating interrupts, that is, from pulling the INTZ pin low. The MASK settings affect the INTZ pin only and have no impact on protection and monitor circuits themselves. When an interrupt is masked, the event causing the interrupt still sets the corresponding bit in the INT register. However, it does not pull the INTZ pin low.

#### 7.3.10.9 SPI

DLPA2005 provides a 4-wire SPI port that supports high-speed serial data transfers up to 33.3 MHz. Support includes register and data buffer write and read operations. The SPI\_CSZ input serves as the active low chip select for the SPI port. The SPI\_CSZ input must be forced low in order to write or read registers and data buffers. When SPI\_CSZ is forced high, the data at the SPI\_DIN input is ignored, and the SPI\_DOUT output is forced to a high-impedance state. The SPI\_DIN input serves as the serial data input for the port; the SPI\_DOUT output serves as the serial data output. The SPI\_CLK input serves as the serial data clock for both the input and output data. Data is latched at the SPI\_DIN input on the rising edge of SPI\_CLK, while data is clocked out of the SPI\_DOUT output on the falling edge of SPI\_CLK. Figure 13 illustrates the SPI port protocol. Byte 0 is referred to as the command byte, where the most significant bit is the write/not read bit. For the W/nR bit, a 1 indicates a write operation, while a 0 indicates a read operation. The SPI port supports write and read operations for multiple sequential register addresses through the implementation of an auto-increment mode. As shown in Figure 13, the auto-increment mode is invoked by simply holding the SPI\_CSZ input low for multiple data bytes. The register address is automatically incremented after each data byte transferred, starting with the address specified by the command byte. After reaching address 0x7Fh the address pointer jumps back to 0x00h.

#### 7.3.11 Password Protected Registers

Register addresses 0x11h through 0x27h can be read-accessed the same way as any other register, but are protected against accidental write operations through the PASSWORD register (address 0x10h). To write to a protected register, follow these steps:

- 1. Write data 0xBAh to register address 0x10h.
- 2. Write data 0xBEh to register address 0x10h.

Both writes must be consecutive, that is, there must be no other read or write operation in between sending the two bytes. After the password has been successfully written, registers 0x11h through 0x27h are unlocked and can be write accessed using the regular SPI protocol. They remain unlocked until any byte other than 0xBAh is written to the PASSWORD register or the part is power cycled.

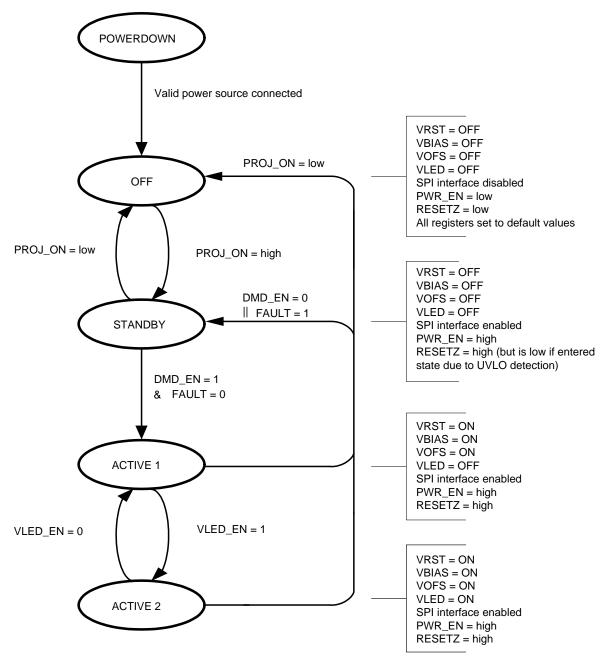

To check if the registers are unlocked, read back the PASSWORD register. If the data returned is 0x00h, the registers are locked. If the PASSWORD register returns 0x01h, the registers are unlocked.

#### 7.4 Device Functional Modes

#### MODES OF OPERATION

- **OFF** This is the lowest-power mode of operation. All power functions are turned off, registers are reset to their default values and the IC does not respond to SPI commands. RESETZ pin is pulled low. The IC will enter OFF mode whenever the PROJ\_ON pin is low.
- **STANDBY** The DMD regulators and LED power (VLED) are turned off, but the IC does respond to the SPI interface. The device enters STANDBY mode whenever PROJ\_ON is set high or DMD\_EN7 bit is set to 0 using the SPI interface after PROJ\_ON is already high. The device also enters STANDBY mode when a fault condition is detected8. (see the section about Protection Circuits on pages 28 & 30)
- ACTIVE1 The DMD supplies are enabled but LED power (VLED) is disabled. PROJ\_ON pin must be high, DMD\_EN bit must be set to 1, and VLED\_EN9 bit is set to 0.
- ACTIVE2 DMD supplies and LED power are enabled. PROJ\_ON pin must be high and DMD\_EN and VLED\_EN bits must both be set to 1.

#### **Device Functional Modes (continued)**

- A. || = OR , & = AND
- B. FAULT = Undervoltage on any supply (except LS\_OUT), thermal shutdown, or UVLO detection
- C. UVLO detection, per the diagram, causes the DLPA2005 to go into the standby state. This is not the lowest power state. If lower power is desired, PROJ\_ON should be set low.
- D. DMD\_EN register bit can be reset or set by SPI writes. DMD\_EN defaults to 0 when PROJ\_ON goes from low to high and then the DPP ASIC software automatically sets it to 1. Also, FAULT = 1 causes the DMD\_EN register bit to be reset.
- E. PWR\_EN is a signal internal to the DLPA2005. This signal turns on the VCORE regulator and the load switch that drives pin LS\_OUT

#### Figure 14. State Diagram

#### Table 3. Device State as a Function of Control-Pin Status

PROJ_ON PIN	STATE
LOW	OFF
HIGH	STANDBY ACTIVE1 ACTIVE2 (Device state depends on DMD_EN and VLED_EN bits and whether there are any fault conditions.)

#### Table 4. Modes of Operation

MODE	DESCRIPTION
OFF	This is the lowest-power mode of operation. All power functions are turned off, registers are reset to their default values, and the IC does not respond to SPI commands. RESETZ pin is pulled low. The IC will enter OFF mode whenever the PROJ_ON pin is low.
STANDBY	The DMD regulators and LED power (VLED) are turned off, but the IC does respond to the SPI. The device enters STANDBY mode whenever PROJ_ON is set high or DMD_EN <sup>(1)</sup> bit is set to 0 using the SPI interface after PROJ_ON is already high. The device also enters STANDBY mode when a fault condition is detected <sup>(2)</sup> . (See <i>Protection Circuits</i> .)
ACTIVE1	The DMD supplies are enabled but LED power (VLED) is disabled. PROJ_ON pin must be high, DMD_EN bit must be set to 1, and VLED_EN <sup>(3)</sup> bit is set to 0.
ACTIVE2	DMD supplies and LED power are enabled. PROJ_ON pin must be high and DMD_EN and VLED_EN bits must both be set to 1.

Settings can be done through Reg01h [9] and Reg2E [119] (1)

Power-good faults, over-voltage, overtemperature shutdown, and undervoltage lockout Settings can be done through Reg47h [60], bit is named VLED\_EN\_SET (2) (3)

#### Table 23. Interrupt Register Bit Definitions

FIELD NAME	BIT		BIT DEFINITION
		103	VLED_OVP VLED buck_boost overvoltage fault interrupt (normal operation resumes) 0 – No fault 1 – Buck_boost output is above OVP threshold
		102	IREG_PG_FAULT V6V power-good fault interrupt (normal operation resumes) 0 – No fault 1 – V6V is not in regulation
		101	PROJ_ON_INT Proj_On interrupt (part enters OFF mode) 0 – Pin is pulled high, normal mode 1 – Pin is pulled low, alerts the DPP that the DMD regulator is about to shut down.
INT	[103:96]	100	DMD_FAULT DMD regulator fault (part enters STANDBY mode and DMD_EN bit is cleared) 0 – No fault 1 – The inductor current is not increasing at the correct rate, likely to be caused by an open inductor. Or, one of the regulator outputs has dropped below the power-good threshold, likely to be caused by a short
		99	UVLO UVLO interrupt (sensed at VINA pin), DMD bit is cleared. 0 – Battery voltage is above the UVLO threshold 1 – Battery voltage has dropped below the UVLO threshold
		98	BAT_LOW_WARN Low battery warning interrupt (sensed at VINA pin, normal operation resumes) 0 – Battery voltage is above the low-battery threshold 1 – Battery voltage has dropped below the low-battery threshold
		97	TS_WARN Thermal warning interrupt (normal operation resumes) 0 – Die temperature is in normal operating range 1 – Die temperature is above the HOT threshold Or, part has not cooled down enough to recover from HOT.
		96	TS_WARN Thermal Warning Interrupt (normal operation resumes) 0 – Die temperature is in normal operating range 1 – Die temperature is above the HOT threshold Or, part has not cooled down enough to recover from HOT.

# 8 Application and Implementation

#### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

A DLPC343x controller can be used with a DLP2010 (.2 WVGA) DMD or DLP3010 (.3 720p) DMD to provide a compact, reliable, high-efficiency display solution for many different video display applications. The DMDs are spatial light modulators which reflect incoming light from an illumination source to one of two directions with the primary direction being into collection optics within a projection lens. The projection lens sends the light to the destination needed for the application. Each application is derived primarily from the optical architecture of the system and the format of the pixel data being input into the DLPC343x.

In display applications using the DLP2010 DMD or DLP3010 DMD, the DLPA2005 provides all needed analog functions including the analog power supplies and the RGB LED driver to provide a robust and efficient display solution. Display applications of interest include pico-projectors embedded in display devices like smart phones, tablets, cameras, and camcorders. Other applications include wearable (near-eye) displays, battery-powered mobile accessory, interactive display, low latency gaming displays, and digital signage.

Alternately, a DLPC150 controller can be used with a DLP2010 or DLP2010NIR DMD. Applications of interest when using the DLPC150 controller include machine vision systems, spectrometers, skin analysis, medical systems, material identification, chemical sensing, infrared projection, and compressive sensing. In a spectroscopy application the DLPC150 controller and DLP2010NIR DMD are often combined with a single element detector to replace expensive InGaAs array-based detector designs. In this application the DMD acts as a wavelength selector reflecting specific wavelengths of light into the single point detector.

## 8.2 Typical Projector Application

A common application when using DLPA2005 with DLP2010 DMD and DLPC3430/DLPC3435 controller is for creating an accessory projector for a smart phone, tablet or any other portable smart device. The DLPC3430/DLPC3435 in an accessory projector typically receives images from a smart device over either HDMI as shown below (WI-FI can also be used to transmit data). DLPA2005 provides power supply sequencing and controls the RGB LED currents as required by the application.

## **Typical Projector Application (continued)**

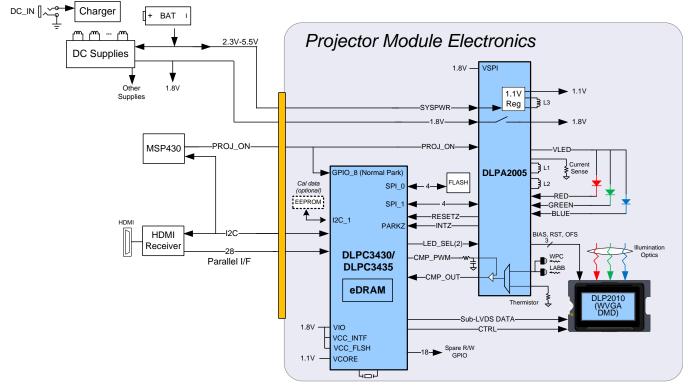

Figure 15. Typical Setup Using DLPA2005

## 8.2.1 Design Requirements

A pico-projector is created by using a DLP chip set comprised of DLP2010 (.2 WVGA) DMD, DLPC3430 or DLPC3435 controller and DLPA2005 PMIC/LED driver. The DLPC3430 or DLPC3435 does the digital image processing, the DLPA2005 provides the needed analog functions for the projector, and DMD is the display device for producing the projected image. In addition to the three DLP chips in the chip set, other chips may be needed. At a minimum a flash part is needed to store the software and firmware to control the DLPC3430 or DLPC3435. The illumination light that is applied to the DMD is typically from red, green, and blue LEDs. These are often contained in three separate packages, but sometimes more than one color of LED die may be in the same package to reduce the overall size of the pico-projector. For connecting the DLPC3430 or DLPC3435 to the front end for receiving images parallel interface is used. While using parallel interface, I<sup>2</sup>C should be connected to the front end for sending commands to the DLPC3430 or DLPC3435. The only power supplies needed external to the projector are the battery (SYSPWR) and a regulated 1.8 V supply. The entire picoprojector can be turned on and off by using a single signal called PROJ\_ON. When PROJ\_ON is high, the projector turns on and begins displaying images. When PROJ ON is set low, the projector turns off and draws just microamps of current on SYSPWR. When PROJ ON is set low, the 1.8 V supply can continue to be left at 1.8 V and used by other non-projector sections of the product. If PROJ ON is low, the DLPA2005 will not draw current on the 1.8 V supply.

### 8.2.2 Detailed Design Procedure

For connecting together the DLP2010, DLPC3430 or DLPC3435 and DLPA2005, see the reference design schematic. When a circuit board layout is created from this schematic a very small circuit board is possible. An example small board layout is included in the reference design data base. Layout guidelines should be followed to achieve a reliable projector. The optical engine that has the LED packages and the DMD mounted to it is typically supplied by an optical OEM who specializes in designing optics for DLP projectors.

# **Typical Projector Application (continued)**

#### 8.2.3 Application Curves

As the LED currents that are driven time-sequentially through the red, green, and blue LEDs are increased, the brightness of the projector increases. This increase is somewhat non-linear, and the curve for typical white screen lumens changes with LED currents. It's assumed that the same current amplitude is applied to the red, green, and blue LEDs.

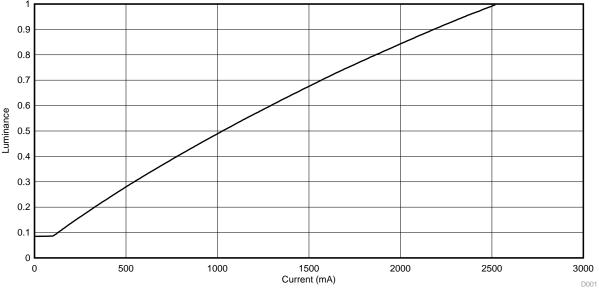

Figure 16. Luminance vs Current

## 8.3 Typical Mobile Sensing Application

A typical embedded system application using the DLPC150 controller and the DLPC2010NIR is shown in Figure 17. In this configuration, the DLPC150 controller supports a 24-bit parallel RGB input, typical of LCD interfaces, from an external source or processor. The DLPC150 controller processes the digital input image and converts the data into the format needed by the DLP2010NIR. The DLP2010NIR steers light by setting specific micromirrors to the "on" position, directing light to the detector, while unwanted micromirrors are set to "off" position, directing light away from the detector. The microprocessor uses an analog-to-digital converter to sample the signal received by the detector, the microprocessor can then plot a spectral response to the light.

## **Typical Mobile Sensing Application (continued)**

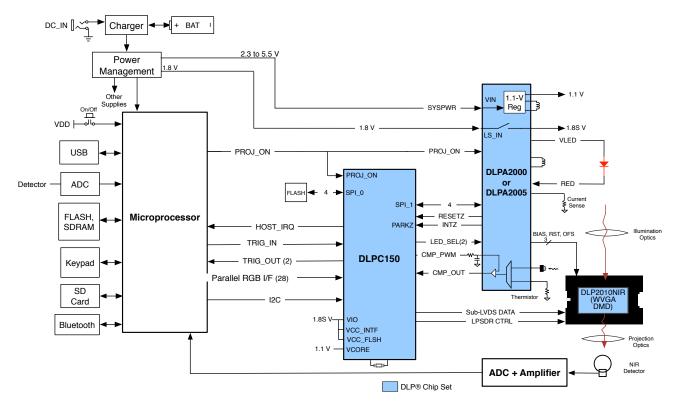

Figure 17. Typical Application Diagram

#### 8.3.1 Design Requirements

All applications using the DLP 0.2-inch WVGA chipset require the:

- DLPC150 controller, and
- DLPA2005 PMIC, and
- DLP2010 or DLP2010NIR DMD

components for operation. The system also requires an external parallel flash memory device loaded with the DLPC150 configuration and support firmware. DLPC150 does the digital image processing and formats the data for the DMD. DLPA2005 PMIC provides the needed analog functions for the DLPC150 and DLP2010 or DLP2010NIR. The chipset has several system interfaces and requires some support circuitry. The following interfaces and support circuitry are required:

- DLPC150 system interfaces:
  - Control interface
  - Trigger interface
  - Input data interface
  - Illumination interface
- DLPC150 support circuitry and interfaces:
  - Reference clock
  - PLL
  - Program memory flash interface
- DMD interfaces:
  - DLPC150 to DMD digital data
  - DLPC150 to DMD control interface
  - DLPC150 to DMD micromirror reset control interface

# **Typical Mobile Sensing Application (continued)**

#### 8.3.2 Detailed Design Procedure

#### 8.3.2.1 Dlpc150 System Interfaces

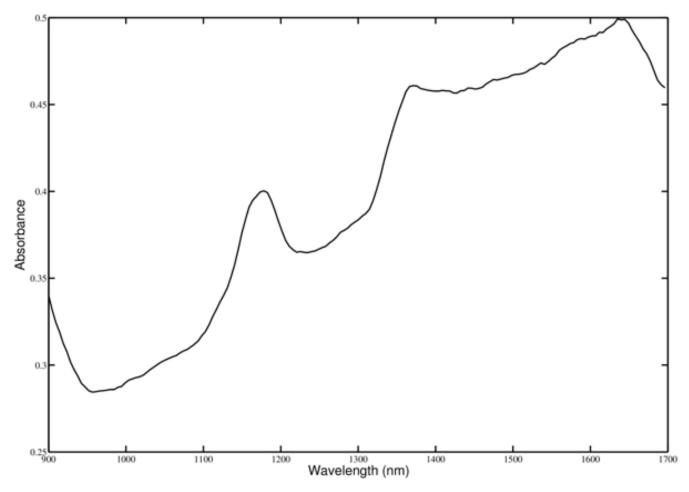

The 0.2-inch WVGA chipset supports a16-bit or 24-bit parallel RGB interface for image data transfers from another device. There are two primary output interfaces: illumination driver control interface and sync outputs.

#### 8.3.2.1.1 Control Interface

The 0.2-inch WVGA chipset supports I2C commands through the control interface. The control interface allows another master processor to send commands to the DLPC150 controller to query system status or perform realtime operations such as LED driver current settings.

### 8.3.3 Application Curve

In a reflective spectroscopy application, a broadband light source illuminates a sample and the reflected light spectrum is dispersed onto the DLP2010NIR. A microprocessor in conjunction with the DLPC150 controls individual DLP2010NIR micromirrors to reflect specific wavelengths of light to a single point detector. The microprocessor uses an analog-to-digital converter to sample the signal received by the detector into a digital value. By sequentially selecting different wavelengths of light and capturing the values at the detector, the microprocessor can then plot a spectral response to the light. This systems allows the measurement of the collected light and derive the wavelengths absorbed by the sample. This process leads to the absorption spectrum shown in Figure 18.

# 9 Power Supply Recommendations

The DLPA2005 is designed to operate from a 2.3 to 6 V input voltage supply or battery. To avoid insufficient supply current due to line drop, ringing due to trace inductance at the VIN terminal, or supply peak current limitations, additional bulk capacitance may be required. In the case ringing that is caused by the interaction with the ceramic input capacitors, an electrolytic or tantalum type capacitor may be needed for damping.

The amount of bulk capacitance required should be evaluated such that the input voltage can remain in spec long enough for a proper fast shutdown to occur for the vofs, vrst, and vbias supplies. The shutdown begins when the input voltage drops below the programmable UVLO threshold such as when the external power supply or battery supply is suddenly removed from the system.

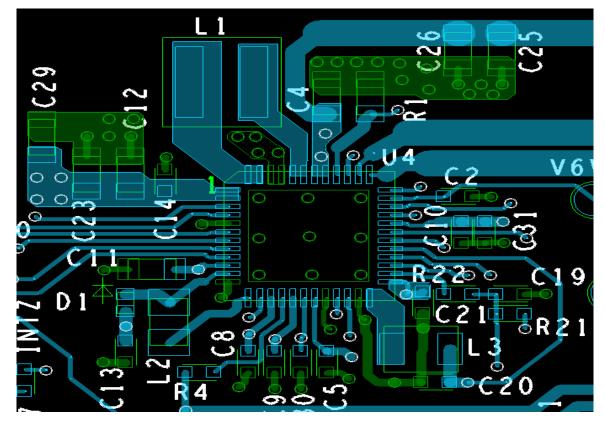

# 10 Layout

### 10.1 Layout Guidelines

As for all chips with switching power supplies, the layout is an important step in the design, especially in the case of high peak currents and high switching frequencies. If the layout is not carefully done, the regulators could show stability problems as well as EMI problems. Therefore, use wide and short traces for the main current paths and for the power ground tracks. Input capacitors, output capacitors, and inductors should be placed as close as possible to the IC.

Figure 19 shows an example layout that has critical parts placed as close as possible to the pins they are connected to. Here are recommendations for the following components:

- R1 is RLIM and is connected via a wide trace (low resistance) to the system ground. The analog ground at pin 5 should be star connected to the point where RLIM is connected to the system ground. Aim on a wide and low-ohmic trace as well, although this one is less critical (tens of mA).
- L1 is the big inductor for the VLED that is connected via two wide traces to the pins
- C4 are the decoupling capacitors for the VLED and they are as close as possible placed to the part and directly connected to ground.
- L3/C20 are components used for the VCORE BUCK. L3 is placed close to the pin and connected with a wide trace to the part. C20 is placed directly beside the inductor and connected to the PGND pin
- L2 This inductor is part of the DMD reset regulators and is also placed as close as possible to the DLPA2005 using wide PCB traces.

## 10.2 Layout Example

Figure 19. Example Layout of DLPA2005

An important consequence of the efficiency numbers shown in Figure 7 is that it enables to perform DLPA2005 thermal calculations. Since the efficiency is not 100%, power is dissipated in the DLPA2005 chip. Due to that dissipation die temperature will rise. For reliability reasons it is good to aim for as low as possible die temperatures. Using a heat sink and airflow are efficient means to keep die temperature reasonably low. In cases that airflow and / or a heat sink are / is not feasible, the system designer should specifically pay attention to the thermal design. The die temperature for regular operation should remain below 120°C.

In the following an example is given of such a thermal calculation. The calculation starts with summarizing all blocks in the DLPA2005 that dissipate. Clearly, the buck-boost converter supplying the LED power is the main source of dissipation. For illustrating purposes here we assume this buck-boost converter to be the only block that dissipates significantly. For the example assume: VOUT=4.8 V (for all three LEDs), IOUT=2.4 A and VIN=5 V. From Figure 7 it can be derived that the related efficiency equals about n<sub>eff</sub>=88%.

The power dissipated by the DLPA2005 is then given by:

$$P_{DISS} = P_{IN} - P_{OUT} = P_{OUT} \left(\frac{100\%}{\eta_{eff}} - 1\right) = 4.8V \cdot 2.4A \cdot \left(\frac{100\%}{88\%} - 1\right) = 1.6W$$

The rise of die temperature due to this power dissipation can be calculated using the thermal resistance from junction to ambient, MJA=27.9°C/W. This calculation yields:

$$T_{JUNCTION} = T_{AMBIENT} + P_{DISS} \cdot \theta_{JA} = 25^{\circ}C + 1.6W \cdot 27.9^{\circ}C / W = 69.6^{\circ}C$$

It is also possible to calculate the maximum allowable ambient temperature to prevent surpassing the maximum die temperature. Assume again the dissipation of PDISS=1.6W. The maximum ambient temperature that is allowed is then given by:

$$T_{AMBIENT-max} = T_{JUNCTION-max} - P_{DISS} \cdot \theta_{JA} = 120^{\circ}C - 1.6W \cdot 27.9^{\circ}C / W = 75.4^{\circ}C$$

It is again stressed here that for proper calculations the total power dissipation of the PAD2005 should be taken into account. On top of that, if components that are close to the PAD2005 also dissipate a significant amount of power, the (local) ambient temperature can be higher than the ambient temperature of the system.

If calculations show that the die temperature will surpass the maximum specified value, two basic options exist:

- Adding a heat sink with or without airflow. This will reduce 0<sub>JA</sub> yielding lower die temperature.
- Lowering the dissipation in the PAD2005 implying lowering the maximum allowable LED current.

## 11.3 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

# 11.4 Glossary

SLYZ022 — TI Glossary.

This glossary lists and explains terms, acronyms, and definitions.

# 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

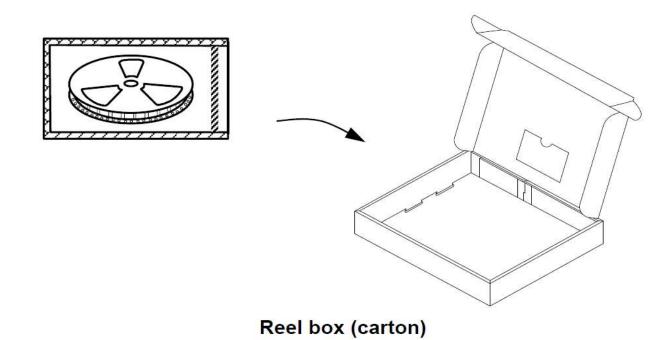

**Cover Tape** The cover tape does not cover the index hole and does not shift to outside from carrier tape.

**ESD Countermeasure** Plastic material used in both carrier tape and cover tape are static dissipative.

**Insertion of Device** The device is located such as symbolization in upper side and lead pins in lower side.

- **Packing Method** The reel is packed into Moisture Barrier bag and fastened by heat-sealing after fixed the end of leader tape by tape. The QFN device packing includes desiccant, humidity indicator.
- **Reel Box** Each Moisture Barrier bag is packed into reel box.
- **Tape Structure** The carrier tape is made of plastic and the structure is shown in above schematic. The device is put on embossed area of carrier tape, and covered by cover tape made of plastic.

# **PACKAGING INFORMATION**

Orderable Device	Status	Package Type	Package	Pins	Package	Eco Plan	Lead/Ball Finish	MSL Peak Temp	Op Temp (°C)	Device Marking	Samples
	(1)		Drawing		Qty	(2)	(6)	(3)		(4/5)	
DLPA2005ERSLR	ACTIVE	VQFN	RSL	48	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR		PAD2005 A4	Samples
DLPA2005ERSLT	ACTIVE	VQFN	RSL	48	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR		PAD2005 A4	Samples

<sup>(1)</sup> The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes. **Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between

the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

<sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

#### **IMPORTANT NOTICE**

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
