

# LP3850x-ADJ, LP3850xA-ADJ 1.5-A Flexcap Low-Dropout Linear Regulator for 2.7-V to 5.5-V Inputs

## 1 Features

- Input Voltage: 2.7 V to 5.5 V
- Adjustable Output Voltage: 0.6 V to 5 V
- FlexCap: Stable with Ceramic, Tantalum, or Aluminum Capacitors
- Stable with 10- $\mu$ F Input and Output Capacitors
- Low Ground-Pin Current
- 25-nA Quiescent Current in Shutdown Mode
- Ensured Output Current of 1.5 A
- Ensured  $V_{ADJ}$  Accuracy of  $\pm 1.5\%$  at 25°C (A Grade)
- Ensured Accuracy of  $\pm 3.5\%$  at 25°C (STD)
- Overtemperature and Overcurrent Protection
- ENABLE Pin (LP38502)

## 2 Applications

- ASIC Power Supplies In:
  - Printers, Graphics Cards, DVD Players
  - Set Top Boxes, Copiers, Routers
- DSP and FPGA Power Supplies
- SMPS Regulator
- Conversion from 3.3-V or 5-V Rail

## 3 Description

TI's FlexCap low-dropout (LDO) linear regulators feature unique compensation that allow use of any type of output capacitor with no limits on minimum or maximum equivalent series resistance (ESR). The LP38500 and LP38502 series of LDOs operates from a 2.7-V to 5.5-V input supply. These ultra-low-dropout linear regulators respond very quickly to step changes in load, making them suitable for low-voltage microprocessor applications. Developed on a CMOS process (utilizing a PMOS pass transistor) the LP38500-ADJ and LP38502-ADJ have low quiescent currents that changes little with load current.

- GND Pin Current: Typically 2 mA at 1.5-A load current.
- Disable Mode: Typically 25-nA quiescent current when the EN pin is pulled low. (LP38502-ADJ)
- Simplified Compensation: Stable with any type of output capacitor, regardless of ESR.
- Precision Output: A grade versions available with 1.5%  $V_{ADJ}$  tolerance (25°C) and 3% over line, load, and temperature.

### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LP38500 LP38502	DDPAK/TO-263 (5)	10.16 mm x 8.42 mm
	TO-263 (5)	10.16 mm x 9.85 mm
	WSON (8)	3.00 mm x 2.50 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

<b>Changes from Revision G (June 2015) to Revision H</b>	<b>Page</b>
• Changed thermal values for KTT (DDPAK/TO-263); add notes 2 and 3 to <i>Thermal Information</i> table .....	<b>4</b>

  

<b>Changes from Revision F (April 2013) to Revision G</b>	<b>Page</b>
• Added Added <i>Device Information</i> and <i>Pin Configuration and Functions</i> sections, <i>ESD Ratings</i> and updated <i>Thermal Information</i> tables, <i>Feature Description</i> , <i>Device Functional Modes</i> , <i>Application and Implementation</i> , <i>Power Supply Recommendations</i> , <i>Layout</i> , <i>Device and Documentation Support</i> , and <i>Mechanical, Packaging, and Orderable Information</i> sections.....	<b>1</b>
• Deleted obsolete heatsinking information for DDPK/TO-263 package .....	<b>16</b>

<b>Changes from Revision E (April 2013) to Revision F</b>	<b>Page</b>
• Changed layout of National Data Sheet to TI format .....	<b>19</b>

## 5 Pin Configurations and Functions

### Pin Functions

NAME	PIN			TYPE	DESCRIPTION
	KTT	NDQ	NGS		
ADJ	5	5	8	O	Sets output voltage
EN	1	1	2	I	Enable (LP38502-ADJ only). Pull high to enable the output, low to disable the output. This pin has no internal bias and must be either tied to the input voltage, or actively driven.
GND	3	3	1	G	Ground
IN	—	—	2	I	Input supply (LP38500-ADJ only). Input supply pins share current and must be connected together on the PC board.
IN	2	2	3, 4	I	Input supply. Input Supply pins share current and must be connected together on the PC board.
N/C	1	1	—	—	In the LP38500-ADJ, this pin has no internal connections. It can be left floating or used for trace routing.
OUT	4	4	5, 6, 7	O	Regulated output voltage. Output pins share current and must be connected together on the PC board.
DAP	√	√	√	—	The DAP is used to remove heat from the device by conducting it to a copper clad area on the PCB which acts as a heatsink. The DAP is electrically connected to the backside of the die. The DAP must be connected to ground potential, but can not be used as the only ground connection.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)(2)</sup>

	MIN	MAX	UNIT
Input pin voltage (survival)	-0.3	6	V
Enable pin voltage (survival)	-0.3	6	V
Output pin voltage (survival)	-0.3	6	V
I <sub>OUT</sub> (survival)	Internally limited		
Power dissipation <sup>(3)</sup>	Internally limited		
Storage temperature, T <sub>stg</sub>	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) If Military/Aerospace specified devices are required, please contact the Texas Instruments Office/ Distributors for availability and specifications.
- (3) Operating junction temperature must be evaluated, and derated as needed, based on ambient temperature (T<sub>A</sub>), power dissipation (P<sub>D</sub>), maximum allowable operating junction temperature (T<sub>J(MAX)</sub>), and package thermal resistance (R<sub>θJA</sub>). See [Application and Implementation](#).

### 6.2 ESD Ratings

			VALUE	UNIT
V <sub>ESD</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	±2000	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. have higher performance.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

	MIN	NOM	MAX	UNIT
Input supply voltage	2.7		5.5	V
Enable input voltage	0		5.5	V
Output current (DC)	0		1.5	A
V <sub>OUT</sub>	0.6		5	V
Junction temperature <sup>(1)</sup>	-40		125	°C

- (1) Operating junction temperature must be evaluated, and derated as needed, based on ambient temperature (T<sub>A</sub>), power dissipation (P<sub>D</sub>), maximum allowable operating junction temperature (T<sub>J(MAX)</sub>), and package thermal resistance (R<sub>θJA</sub>). See [Application and Implementation](#).

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>	LP38500 and LP38502			UNIT
	KTT(DDPAK/TO-263)	NDQ (TO-263)	NGS (WSON)	
	5 PINS	5 PINS	8 PINS	
R <sub>θJA</sub> <sup>(2)</sup> Junction-to-ambient thermal resistance	41.8	33.3	52.5 <sup>(3)</sup>	°C/W
R <sub>θJC(top)</sub> Junction-to-case (top) thermal resistance	45.0	22.1	53.6	°C/W
R <sub>θJB</sub> Junction-to-board thermal resistance	24.8	16.9	26.1	°C/W
Ψ <sub>JT</sub> Junction-to-top characterization parameter	13.1	5.8	0.6	°C/W
Ψ <sub>JB</sub> Junction-to-board characterization parameter	23.8	16.8	26.3	°C/W
R <sub>θJC(bot)</sub> Junction-to-case (bottom) thermal resistance	2.4	2.3	7.4	°C/W

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).
- (2) Thermal resistance value R<sub>θJA</sub> is based on the EIA/JEDEC High-K printed circuit board defined by: JESD51-7, *High Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*.
- (3) The PCB for the NGN (WSON) package R<sub>θJA</sub> includes thermal vias under the exposed thermal pad per EIA/JEDEC JESD51-5.

## 6.5 Electrical Characteristics

Unless otherwise specified  $V_{IN} = 3.3\text{ V}$ ,  $I_{OUT} = 10\text{ mA}$ ,  $C_{IN} = 10\text{ }\mu\text{F}$ ,  $C_{OUT} = 10\text{ }\mu\text{F}$ ,  $V_{EN} = V_{IN}$ ,  $V_{OUT} = 1.8\text{ V}$ . Minimum and maximum limits apply over the junction temperature ( $T_J$ ) range of  $-40^\circ\text{C}$  to  $+125^\circ\text{C}$  and are specified through test, design, or statistical correlation. Typical values represent the most likely parametric norm at  $T_J = 25^\circ\text{C}$ , and are provided for reference purposes only.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$V_{ADJ}$	Adjust pin voltage <sup>(1)</sup>	$2.7\text{ V} \leq V_{IN} \leq 5.5\text{ V}$ $10\text{ mA} \leq I_{OUT} \leq 1.5\text{ A}$ $T_J = 25^\circ\text{C}$	0.584	0.605	0.626	V
		$2.7\text{ V} \leq V_{IN} \leq 5.5\text{ V}$ $10\text{ mA} \leq I_{OUT} \leq 1.5\text{ A}$	0.575		0.635	
$V_{ADJ}$	Adjust pin voltage (A grade) <sup>(1)</sup>	$2.7\text{ V} \leq V_{IN} \leq 5.5\text{ V}$ $10\text{ mA} \leq I_{OUT} \leq 1.5\text{ A}$ $T_J = 25^\circ\text{C}$	0.596	0.605	0.614	V
		$2.7\text{ V} \leq V_{IN} \leq 5.5\text{ V}$ $10\text{ mA} \leq I_{OUT} \leq 1.5\text{ A}$	0.587		0.623	
$I_{ADJ}$	ADJUST pin bias current	$2.7\text{ V} \leq V_{IN} \leq 5.5\text{ V}$ $T_J = 25^\circ\text{C}$		50		nA
		$2.7\text{ V} \leq V_{IN} \leq 5.5\text{ V}$			750	nA
$V_{DO}$	Dropout voltage <sup>(2)</sup>	$I_{OUT} = 1.5\text{ A}$ $T_J = 25^\circ\text{C}$		220	275	mV
		$I_{OUT} = 1.5\text{ A}$			375	mV
$\frac{\Delta V_{OUT}}{\Delta V_{IN}}$	Output voltage line regulation <sup>(1)(3)</sup>	$2.7\text{ V} \leq V_{IN} \leq 5.5\text{ V}$ $T_J = 25^\circ\text{C}$		0.04		%/V
		$2.7\text{ V} \leq V_{IN} \leq 5.5\text{ V}$		0.05		%/V
$\frac{\Delta V_{OUT}}{\Delta I_{OUT}}$	Output voltage load regulation <sup>(1)(4)</sup>	$10\text{ mA} < I_{OUT} < 1.5\text{ A}$ $T_J = 25^\circ\text{C}$		0.18		%/A
		$10\text{ mA} < I_{OUT} < 1.5\text{ A}$		0.33		%/A
$I_{GND}$	Ground pin current in normal operation mode	$10\text{ mA} < I_{OUT} < 1.5\text{ A}$ $T_J = 25^\circ\text{C}$		2	3.5	mA
		$10\text{ mA} < I_{OUT} < 1.5\text{ A}$			4.5	
$I_{DISABLED}$	Ground pin current	$V_{EN} < V_{IL(EN)}$ , $T_J = 25^\circ\text{C}$		0.025	0.125	$\mu\text{A}$
		$V_{EN} < V_{IL(EN)}$			15	
$I_{OUT(PK)GN D}$	Peak output current	$V_{OUT} \geq V_{OUT(NOM)} - 5\%$		3.6		A
$I_{SC}$	Short-circuit current	$V_{OUT} = 0\text{ V}$ , $T_J = 25^\circ\text{C}$		3.7		A
		$V_{OUT} = 0\text{ V}$	2			
<b>ENABLE INPUT (LP38502 Only)</b>						
$V_{IH(EN)}$	Enable logic high	$V_{OUT} = \text{ON}$	1.4			V
$V_{IL(EN)}$	Enable logic low	$V_{OUT} = \text{OFF}$			0.65	V
$t_{d(off)}$	Turnoff delay	Time from $V_{EN} < V_{IL(EN)}$ to $V_{OUT} = \text{OFF}$ $I_{LOAD} = 1.5\text{ A}$		25		$\mu\text{s}$
$t_{d(on)}$	Turnon delay	Time from $V_{EN} > V_{IH(EN)}$ to $V_{OUT} = \text{ON}$ $I_{LOAD} = 1.5\text{ A}$		25		$\mu\text{s}$
$I_{IH(EN)}$	Enable pin high current	$V_{EN} = V_{IN}$		1		nA
$I_{IL(EN)}$	Enable pin low current	$V_{EN} = 0\text{ V}$		0.1		

- (1) The line and load regulation specification contains only the typical number. However, the limits for line and load regulation are included in the adjust voltage tolerance specification.
- (2) Dropout voltage is defined as the minimum input to output differential voltage at which the output drops 2% below the nominal value. For any output voltage less than 2.5V, the minimum  $V_{IN}$  operating voltage is the limiting factor.
- (3) Output voltage line regulation is defined as the change in output voltage from the nominal value due to change in the input line voltage.
- (4) Output voltage load regulation is defined as the change in output voltage from the nominal value due to change in the load current.

## Electrical Characteristics (continued)

Unless otherwise specified  $V_{IN} = 3.3\text{ V}$ ,  $I_{OUT} = 10\text{ mA}$ ,  $C_{IN} = 10\text{ }\mu\text{F}$ ,  $C_{OUT} = 10\text{ }\mu\text{F}$ ,  $V_{EN} = V_{IN}$ ,  $V_{OUT} = 1.8\text{ V}$ . Minimum and maximum limits apply over the junction temperature ( $T_J$ ) range of  $-40^\circ\text{C}$  to  $+125^\circ\text{C}$  and are specified through test, design, or statistical correlation. Typical values represent the most likely parametric norm at  $T_J = 25^\circ\text{C}$ , and are provided for reference purposes only.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>AC PARAMETERS</b>						
PSRR	Ripple rejection	$V_{IN} = 3\text{ V}$ , $I_{OUT} = 1.5\text{ A}$ , $f = 120\text{ Hz}$		58		dB
		$V_{IN} = 3\text{ V}$ , $I_{OUT} = 1.5\text{ A}$ , $f = 1\text{ kHz}$		56		
$\rho_n(f)$	Output noise density	$f = 120\text{ Hz}$ , $C_{OUT} = 10\text{ }\mu\text{F CER}$		1		$\mu\text{V}/\sqrt{\text{Hz}}$
$e_n$	Output noise voltage	$\text{BW} = 100\text{ Hz} - 100\text{ kHz}$ $C_{OUT} = 10\text{ }\mu\text{F CER}$		100		$\mu\text{V}(\text{rms})$

## 7 Detailed Description

### 7.1 Overview

The LP38500-ADJ and LP38502-ADJ are flex-cap and low-dropout adjustable regulators, the output voltage can be set from 0.6 V to 5 V. Standard regulator features, such as overcurrent and overtemperature protections, are also included.

The LP38500-ADJ and LP38502-ADJ contains several features:

- Stable with any type of output capacitor
- Fast load transient response
- Disable Mode (LP38502-ADJ only)

### 7.2 Functional Block Diagrams

Figure 10. LP38500-ADJ DDPAK/TO-263 Block Diagram

Figure 11. LP38502-ADJ DDPAK/TO-263 Block Diagram

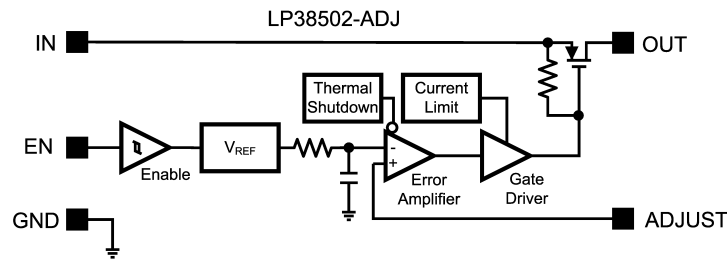

Figure 12. LP38500-ADJ WSON Block Diagram

## Functional Block Diagrams (continued)

**Figure 13. LP38502-ADJ WSON Block Diagram**

## 7.3 Feature Description

### 7.3.1 Stability And Phase Margin

Any regulator which operates using a feedback loop must be compensated in such a way as to ensure adequate phase margin, which is defined as the difference between the phase shift and  $-180$  degrees at the frequency where the loop gain crosses unity (0 dB). For most LDO regulators, the ESR of the output capacitor is required to create a zero to add enough phase lead to ensure stable operation. The LP38500-ADJ and LP38502-ADJ each have a unique internal compensation circuit which maintains phase margin regardless of the ESR of the output capacitor, so any type of capacitor may be used.

Figure 14 shows the gain/phase plot of the LP38500-ADJ and LP38502-ADJ with an output of 1.2 V, a 10- $\mu$ F ceramic output capacitor, delivering 1.5 A of load current. It can be seen that the unity-gain crossover occurs at 150 kHz, and the phase margin is about  $40^\circ$  (which is very stable).

**Figure 14. Gain-Bandwidth Plot for 1.5-A Load**

Figure 15 shows the gain and phase with no external load. In this case, the only load is provided by the gain setting resistors (about 12 k $\Omega$  total in this test). It is immediately obvious that the unity-gain frequency is significantly lower (dropping to about 500 Hz), at which point the phase margin is  $125^\circ$ .

## Feature Description (continued)

**Figure 15. Gain-Bandwidth Plot for No Load**

The reduction in unity-gain bandwidth as load current is reduced is normal for any LDO regulator using a P-FET or PNP pass transistor, because they have a pole in the loop gain function given by:

$$F_P = \frac{1}{2 \times \pi \times R_L \times C_{OUT}} \quad (1)$$

This illustrates how the pole goes to the highest frequency when  $R_L$  is minimum value (maximum load current). In general, LDOs have maximum bandwidth (and lowest phase margin) at full load current. In the case of the LP38500-ADJ or LP38502-ADJ, it can be seen that it has good phase margin even when using ceramic capacitors with ESR values of only a few mΩ.

### 7.3.2 Load Transient Response

Load transient response is defined as the change in regulated output voltage which occurs as a result of a change in load current. Many applications have loads which vary, and the control loop of the voltage regulator must adjust the current in the pass FET transistor in response to load current changes. For this reason, regulators with wider bandwidths often have better transient response.

The LP38500-ADJ and LP38502-ADJ employs an internal feed-forward design which makes the load transient response much faster than would be predicted simply by loop speed: this feedforward means any voltage changes appearing on the output are coupled through to the high-speed driver used to control the gate of the pass FET along a signal path using very fast FET devices. Because of this, the pass transistor's current can change very quickly.

Figure 15 shows the output voltage load transient which occurs on a 1.8-V output when the load changes from 0.1 A to 1.5 A at an average slew rate of 0.5 A/μs. As shown, the peak output voltage change from nominal is about 40 mV, which is about 2.2%.

**Figure 16. Load Transient Response**

## Feature Description (continued)

In cases where extremely fast load changes occur, the output capacitance may have to be increased. For fast changing loads, the internal parasitics of ESR (equivalent series resistance) and ESL (equivalent series inductance) degrade the capacitor's ability to source current quickly to the load. The best capacitor types for transient performance are (in order):

1. Multilayer Ceramic: with the lowest values of ESR and ESL, they can have ESR values in the range of a few m $\Omega$ . Disadvantage: capacitance values above about 22  $\mu$ F significantly increase in cost.
2. Low-ESR Aluminum Electrolytics: these are aluminum types (like OSCON) with a special electrolyte which provides extremely low ESR values, and are the closest to ceramic performance while still providing large amounts of capacitance. These are cheaper (by capacitance) than ceramic.
3. Solid tantalum: can provide several hundred  $\mu$ F of capacitance, transient performance is slightly worse than OSCON type capacitors, cheaper than ceramic in large values.
4. General purpose aluminum electrolytics: cheap and provide a lot of capacitance, but give the worst performance.

In general, managing load transients is done by paralleling ceramic capacitance with a larger bulk capacitance. In this way, the ceramic can source current during the rapidly changing edge and the bulk capacitor can support the load current after the first initial spike in current.

### 7.3.3 Dropout Voltage

The dropout voltage of a regulator is defined as the input-to-output differential required by the regulator to keep the output voltage within 2% of the nominal value. For CMOS LDOs, the dropout voltage is the product of the load current and the  $R_{DS(on)}$  of the internal MOSFET pass element.

Since the output voltage is beginning to “drop out” of regulation when it drops by 2%, electrical performance of the device will be reduced compared to the values listed in the Electrical Characteristics table for some parameters (line and load regulation and PSRR would be affected).

### 7.3.4 Reverse Current Path

The internal MOSFET pass element in the LP38500-ADJ and LP38502-ADJ has an inherent parasitic diode. During normal operation, the input voltage is higher than the output voltage and the parasitic diode is reverse biased. However, if the output is pulled above the input in an application, then current flows from the output to the input as the parasitic diode gets forward biased. The output can be pulled above the input as long as the current in the parasitic diode is limited to 200-mA continuous and 1-A peak. The regulator output pin should not be taken below ground potential. If the LP38500-ADJ and LP38502-ADJ is used in a dual-supply system where the regulator load is returned to a negative supply, the output must be diode-clamped to ground.

## 7.4 Device Functional Modes

### 7.4.1 Short-Circuit Protection

The LP38500-ADJ and LP38502-ADJ contain internal current limiting which will reduce output current to a safe value if the output is overloaded or shorted. Depending upon the value of  $V_{IN}$ , thermal limiting may also become active as the average power dissipated causes the die temperature to increase to the limit value (about 170°C). The hysteresis of the thermal shutdown circuitry can result in a “cyclic” behavior on the output as the die temperature heats and cools.

### 7.4.2 Enable Operation (LP38502-ADJ Only)

The Enable pin (EN) must be actively terminated by either a 10-k $\Omega$  pull-up resistor to  $V_{IN}$ , or a driver which actively pulls high and low (such as a CMOS rail to rail comparator). If active drive is used, the pull-up resistor is not required. This pin must be tied to  $V_{IN}$  if not used (it must not be left floating).

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The LP38500-ADJ and LP38502-ADJ devices can provide 1.5-A output current with 2.7-V to 5.5-V input voltage. These ultra-low-dropout linear regulators respond very quickly to step changes in load, making them suitable for low-voltage microprocessor applications. Input and output capacitors of at least 10  $\mu\text{F}$  are required.

### 8.2 Typical Applications

Figure 17. Typical Circuit (LP38500)

Figure 18. Typical Circuit (LP38502)

#### 8.2.1 Design Requirements

For LP3850x-ADJ typical applications, use the parameters listed in [Table 1](#) as the input parameters.

Table 1. Design Parameters

DESIGN PARAMETERS	VALUE
Input voltage	2.7 V to 5.5 V
Output voltage	0.6 V to 5 V (adjustable)
Output current	1.5 A (maximum)
Input capacitor	10 $\mu\text{F}$ (minimum)
Output capacitor	10 $\mu\text{F}$ (minimum)

#### 8.2.2 Detailed Design Procedure

##### 8.2.2.1 External Capacitors

The LP38500-ADJ and LP38502-ADJ require that at least 10- $\mu\text{F}$  ( $\pm 20\%$ ) capacitors be used at the input and output pins located within one cm of the device. Larger capacitors may be used without limit on size for both  $C_{\text{IN}}$  and  $C_{\text{OUT}}$ . Capacitor tolerances such as temperature variation and voltage loading effects must be considered when selecting capacitors to ensure that they will provide the minimum required amount of capacitance under all operating conditions for the application.

In general, ceramic capacitors are best for noise bypassing and transient response because of their ultra low ESR. It must be noted that if ceramics are used, only the types with X5R or X7R dielectric ratings should be used (never Z5U or Y5F). Capacitors which have the Z5U or Y5F characteristics will see a drop in capacitance of as much as 50% if their temperature increases from 25°C to 85°C. In addition, the capacitance drops significantly with applied voltage: a typical Z5U or Y5F capacitor can lose as much as 60% of its rated capacitance if only half of the rated voltage is applied to it. For these reasons, only X5R and X7R ceramics should be used.

### 8.2.2.2 Input Capacitor

All linear regulators can be affected by the source impedance of the voltage which is connected to the input. If the source impedance is too high, the reactive component of the source may affect the control loop's phase margin. *To ensure proper loop operation, the ESR of the capacitor used for  $C_{IN}$  must not exceed  $0.5 \Omega$ .* Any good quality ceramic capacitor will meet this requirement, as well as many good quality tantalums. Aluminum electrolytic capacitors may also work, but can possibly have an ESR which increases significantly at cold temperatures. If the ESR of the input capacitor may exceed  $0.5 \Omega$ , it is recommended that a  $2.2\text{-}\mu\text{F}$  ceramic capacitor be used in parallel, as this will assure stable loop operation.

### 8.2.2.3 Output Capacitor

Any type of capacitor may be used for  $C_{OUT}$ , with no limitations on minimum or maximum ESR, as long as the minimum amount of capacitance is present. The amount of capacitance can be increased without limit. Increasing the size of  $C_{OUT}$  typically will give improved load transient response.

### 8.2.2.4 Setting The Output Voltage

The output voltage of the LP38500/2-ADJ can be set to any value between 0.6V and 5V using two external resistors shown as R1 and R2 in Figure 19.

**Figure 19. Setting Output Voltage**

The value of R2 should always be less than or equal to 10 k $\Omega$  for good loop compensation. R1 can be selected for a given  $V_{OUT}$  using the following formula:

$$V_{OUT} = V_{ADJ} (1 + R1/R2) + I_{ADJ} (R1)$$

where

- $V_{ADJ}$  is the adjust pin voltage
  - $I_{ADJ}$  is the bias current flowing into the adjust pin
- (2)

### 8.2.2.5 RFI/EMI Susceptibility

Radio Frequency Interference (RFI) and Electro-Magnetic Interference (EMI) can degrade any integrated circuit's performance because of the small dimensions of the geometries inside the device. In applications where circuit sources are present which generate signals with significant high frequency energy content ( $> 1 \text{ MHz}$ ), care must be taken to ensure that this does not affect the device regulator.

If RFI/EMI noise is present on the input side of the regulator (such as applications where the input source comes from the output of a switching regulator), good ceramic bypass capacitors must be used at the input pin of the device to reduce the amount of EMI conducted into the device.

If the LP38500, LP38502-ADJ output is connected to a load which switches at high speed (such as a clock), the high-frequency current pulses required by the load must be supplied by the capacitors on the device output. Since the bandwidth of the regulator loop is less than 300 kHz, the control circuitry cannot respond to load changes above that frequency. This means the effective output impedance of the device at frequencies above 300 kHz is determined only by the output capacitor(s). Ceramic capacitors provide the best performance in this type of application.

In applications where the load is switching at high speed, the output of the device may need RF isolation from the load. In such cases, it is recommended that some inductance be placed between the output capacitor and the load, and good RF bypass capacitors be placed directly across the load. PCB layout is also critical in high noise environments, since RFI/EMI is easily radiated directly into PC traces. Noisy circuitry should be isolated from *clean* circuits where possible, and grounded through a separate path. At MHz frequencies, ground planes begin to look inductive and RFI/EMI can cause ground bounce across the ground plane. In multi-layer PC Board applications, care should be taken in layout so that noisy power and ground planes do not radiate directly into adjacent layers which carry analog power and ground.

### 8.2.2.6 Output Noise

Noise is specified in two ways:

- Spot noise or output noise density is the RMS sum of all noise sources, measured at the regulator output, at a specific frequency (measured with a 1-Hz bandwidth). This type of noise is usually plotted on a curve as a function of frequency.
- Total output noise or broadband noise is the RMS sum of spot noise over a specified bandwidth, usually several decades of frequencies.

Spot noise is measured in units  $\mu\text{V}/\sqrt{\text{Hz}}$  or  $\text{nV}/\sqrt{\text{Hz}}$  and total output noise is measured in  $\mu\text{V}_{(\text{rms})}$ . The primary source of noise in low-dropout regulators is the internal reference. In CMOS regulators, noise has a low-frequency component and a high frequency component, which depend strongly on the silicon area and quiescent current.

Noise can generally be reduced in two ways: increase the transistor area or increase the reference current. However, enlarging the transistors will increase die size, and increasing the reference current means higher total supply current (ground pin current).

### 8.2.3 Application Curves

Figure 20. Turnon Time

Figure 21. Turnon Time

## 9 Power Supply Recommendations

The LP38500-ADJ and LP38502-ADJ devices are designed to operate from an input voltage supply range between 2.7 V and 5.5 V. The input voltage range provides adequate headroom in order for the device to have a regulated output. This input supply must be well regulated. An input capacitor of at least 10  $\mu\text{F}$  is required.

### 9.1 Power Dissipation/Heatsinking

The maximum power dissipation ( $P_{D(\text{MAX})}$ ) of the LP38500-ADJ and LP38502-ADJ is limited by the maximum junction temperature of 125°C, along with the maximum ambient temperature ( $T_{A(\text{MAX})}$ ) of the application, and the thermal resistance ( $R_{\theta\text{JA}}$ ) of the package. Under all possible conditions, the junction temperature ( $T_{\text{J}}$ ) must be within the range specified in the [Recommended Operating Conditions](#). The total power dissipation of the device is given by:

$$P_{\text{D}} = ((V_{\text{IN}} - V_{\text{OUT}}) \times I_{\text{OUT}}) + (V_{\text{IN}} \times I_{\text{GND}})$$

where

- $I_{\text{GND}}$  is the operating ground current of the device (specified under [Electrical Characteristics](#)) (3)

The maximum allowable junction temperature rise ( $\Delta T_{\text{J}}$ ) depends on the maximum expected ambient temperature ( $T_{A(\text{MAX})}$ ) of the application, and the maximum allowable junction temperature ( $T_{\text{J}(\text{MAX})}$ ):

$$\Delta T_{\text{J}} = T_{\text{J}(\text{MAX})} - T_{A(\text{MAX})} \quad (4)$$

The maximum allowable value for junction-to-ambient thermal resistance,  $R_{\theta\text{JA}}$ , can be calculated using the formula:

$$R_{\theta\text{JA}} = \Delta T_{\text{J}} / P_{D(\text{MAX})} \quad (5)$$

The LP38500-ADJ and LP38502-ADJ are available in the DDPAK/TO-263, TO-263, and WSON packages. The thermal resistance depends on the amount of copper area allocated to heat transfer.

## 10 Layout

### 10.1 Layout Guidelines

#### 10.1.1 Printed Circuit Board Layout

Good layout practices will minimize voltage error and prevent instability which can result from ground loops. The input and output capacitors should be directly connected to the device pins with short traces that have no other current flowing in them (Kelvin connect).

The best way to do this is to place the capacitors very near the device and make connections directly to the device pins via short traces on the top layer of the PCB. The regulator's ground pin should be connected through vias to the internal or backside ground plane so that the regulator has a single point ground.

The external resistors which set the output voltage must also be located very near the device with all connections directly tied via short traces to the pins of the device (Kelvin connect). Do not connect the resistive divider to the load point or DC error will be induced.

### 10.2 Layout Examples

Figure 22. LP38500-ADJ TO-263 Layout (LP38500)

Layout Examples (continued)

Figure 23. LP38502-ADJ TO-263 Layout

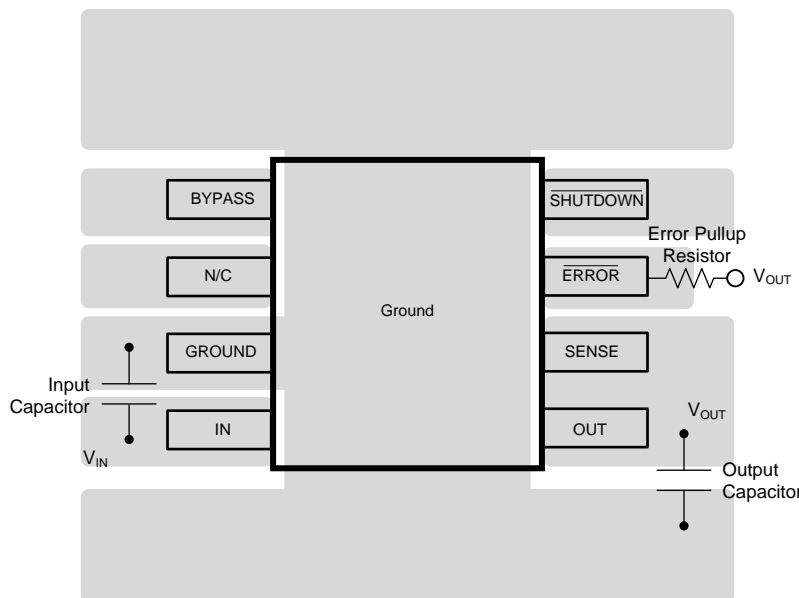

Figure 24. LP3850x WSON Layout

10.2.1 Heatsinking WSON Package

The junction-to-ambient thermal resistance for the WSON package is dependent on how much PCB copper is present to conduct heat away from the device. The LP38502SD-ADJ evaluation board (980600046-100) was tested and gave a result of about 52.5°C/W with a power dissipation of 1 W and no external airflow. This evaluation board is a two layer board using two ounce copper, and the copper area on topside for heatsinking is approximately two square inches. Multiple vias under the DAP also thermally connect to the backside layer which has about three square inches of copper dedicated to heatsinking.

With four thermal vias directly under the DAP to the first copper plane, the modeling predicts a  $R_{\theta JA}$  of 52.5°C/W.

Adding a dog-bone copper area with four additional thermal vias in the dog-bone area to the first copper plane can improve  $R_{\theta JA}$  to 45°C/W.

## Layout Examples (continued)

See Application Note *AN-1520 A Guide to Board Layout for Best Thermal Resistance for Exposed Packages (SNVA183)* for additional thermal considerations for printed circuit board layouts.

## 11 Device and Documentation Support

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.

### Products

Audio	<a href="http://www.ti.com/audio">www.ti.com/audio</a>
Amplifiers	<a href="http://amplifier.ti.com">amplifier.ti.com</a>
Data Converters	<a href="http://dataconverter.ti.com">dataconverter.ti.com</a>
DLP® Products	<a href="http://www.dlp.com">www.dlp.com</a>
DSP	<a href="http://dsp.ti.com">dsp.ti.com</a>
Clocks and Timers	<a href="http://www.ti.com/clocks">www.ti.com/clocks</a>
