

SBOS092A – JUNE 1998 – REVISED NOVEMBER 2003

4-20mA CURRENT TRANSMITTER with Bridge Excitation and Linearization

FEATURES

- LOW TOTAL UNADJUSTED ERROR
- 2.5V, 5V BRIDGE EXCITATION REFERENCE
- 5.1V REGULATOR OUTPUT
- LOW SPAN DRIFT: $\pm 25\text{ppm}/^\circ\text{C}$ max
- LOW OFFSET DRIFT: $0.25\mu\text{V}/^\circ\text{C}$
- HIGH PSR: 110dB min
- HIGH CMR: 86dB min
- WIDE SUPPLY RANGE: 7.5V to 36V
- 14-PIN DIP AND SO-14 SURFACE-MOUNT

DESCRIPTION

The XTR106 is a low cost, monolithic 4-20mA, two-wire current transmitter designed for bridge sensors. It provides complete bridge excitation (2.5V or 5V reference), instrumentation amplifier, sensor linearization, and current output circuitry. Current for powering additional external input circuitry is available from the V_{REG} pin.

The instrumentation amplifier can be used over a wide range of gain, accommodating a variety of input signal types and sensors. Total unadjusted error of the complete current transmitter, including the linearized bridge, is low enough to permit use without adjustment in many applications. The XTR106 operates on loop power supply voltages down to 7.5V.

Linearization circuitry provides second-order correction to the transfer function by controlling bridge excitation voltage. It provides up to a 20:1 improvement in nonlinearity, even with low cost transducers.

The XTR106 is available in 14-pin plastic DIP and SO-14 surface-mount packages and is specified for the -40°C to $+85^\circ\text{C}$ temperature range. Operation is from -55°C to $+125^\circ\text{C}$.

APPLICATIONS

- PRESSURE BRIDGE TRANSMITTERS
- STRAIN GAGE TRANSMITTERS
- TEMPERATURE BRIDGE TRANSMITTERS
- INDUSTRIAL PROCESS CONTROL
- SCADA REMOTE DATA ACQUISITION
- REMOTE TRANSDUCERS
- WEIGHING SYSTEMS
- ACCELEROMETERS

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

NOTES: (1) Describes accuracy of the 4mA low-scale offset current. Does not include input amplifier effects. Can be trimmed to zero. (2) Does not include initial error or TCR of gain-setting resistor, R_G . (3) Increasing the full-scale input range improves nonlinearity. (4) Does not include Zero Output initial error. (5) Voltage measured with respect to I_{RET} pin. (6) See "Linearization" text for detailed explanation. V_{FS} = full-scale V_{IN} .

PIN CONFIGURATION

PACKAGE/ORDERING INFORMATION

For the most current package and ordering information, see the Package Option Addendum at the end of this data sheet.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Power Supply, $V+$ (referenced to I_O pin)	40V
Input Voltage, V_{IN+} , V_{IN-} (referenced to I_{RET} pin)	0V to $V+$
Storage Temperature Range	-55°C to +125°C
Lead Temperature (soldering, 10s)	+300°C
Output Current Limit	Continuous
Junction Temperature	+165°C

NOTE: (1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability.

ELECTROSTATIC DISCHARGE SENSITIVITY

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

APPLICATIONS INFORMATION

Figure 1 shows the basic connection diagram for the XTR106. The loop power supply, V_{PS} , provides power for all circuitry. Output loop current is measured as a voltage across the series load resistor, R_L . A $0.01\mu\text{F}$ to $0.03\mu\text{F}$ supply bypass capacitor connected between $V+$ and I_O is recommended. For applications where fault and/or overload conditions might saturate the inputs, a $0.03\mu\text{F}$ capacitor is recommended.

A 2.5V or 5V reference is available to excite a bridge sensor. For 5V excitation, pin 14 (V_{REF5}) should be connected to the bridge as shown in Figure 1. For 2.5V excitation, connect pin 13 ($V_{REF2.5}$) to pin 14 as shown in Figure 3b. The output terminals of the bridge are connected to the instrumentation amplifier inputs, V_{IN+} and V_{IN-} . A $0.01\mu\text{F}$ capacitor is shown connected between the inputs and is recommended for high impedance bridges ($> 10\text{k}\Omega$). The resistor R_G sets the gain of the instrumentation amplifier as required by the full-scale bridge voltage, V_{FS} .

Lin Polarity and R_{LIN} provide second-order linearization correction to the bridge, achieving up to a 20:1 improvement in linearity. Connections to Lin Polarity (pin 12) determine the polarity of nonlinearity correction and should be connected either to I_{RET} or V_{REG} . Lin Polarity should be connected to V_{REG} even if linearity correction is not desired. R_{LIN} is chosen according to the equation in Figure 1 and is dependent on K_{LIN} (linearization constant) and the bridge's nonlinearity relative to V_{FS} (see "Linearization" section).

The transfer function for the complete current transmitter is:

$$I_O = 4\text{mA} + V_{IN} \cdot (40/R_G) \quad (1)$$

V_{IN} in Volts, R_G in Ohms

where V_{IN} is the differential input voltage. As evident from the transfer function, if no R_G is used ($R_G = \infty$), the gain is zero and the output is simply the XTR106's zero current.

A negative input voltage, V_{IN} , will cause the output current to be less than 4mA. Increasingly negative V_{IN} will cause the output current to limit at approximately 1.6mA. If current is being sourced from the reference and/or V_{REG} , the current limit value may increase. Refer to the Typical Performance Curves, "Under-Scale Current vs $I_{REF} + I_{REG}$ " and "Under-Scale Current vs Temperature."

Increasingly positive input voltage (greater than the full-scale input, V_{FS}) will produce increasing output current according to the transfer function, up to the output current limit of approximately 28mA. Refer to the Typical Performance Curve, "Over-Scale Current vs Temperature."

The I_{RET} pin is the return path for all current from the references and V_{REG} . I_{RET} also serves as a local ground and is the reference point for V_{REG} and the on-board voltage references. The I_{RET} pin allows any current used in external circuitry to be sensed by the XTR106 and to be included in the output current without causing error. The input voltage range of the XTR106 is referred to this pin.

FIGURE 1. Basic Bridge Measurement Circuit with Linearization.

EXTERNAL TRANSISTOR

External pass transistor, Q_1 , conducts the majority of the signal-dependent 4-20mA loop current. Using an external transistor isolates the majority of the power dissipation from the precision input and reference circuitry of the XTR106, maintaining excellent accuracy.

Since the external transistor is inside a feedback loop its characteristics are not critical. Requirements are: $V_{CEO} = 45V$ min, $\beta = 40$ min and $P_D = 800mW$. Power dissipation requirements may be lower if the loop power supply voltage is less than 36V. Some possible choices for Q_1 are listed in Figure 1.

The XTR106 can be operated without an external pass transistor. Accuracy, however, will be somewhat degraded due to the internal power dissipation. Operation without Q_1 is not recommended for extended temperature ranges. A resistor ($R = 3.3k\Omega$) connected between the I_{RET} pin and the E (emitter) pin may be needed for operation below $0^\circ C$ without Q_1 to guarantee the full 20mA full-scale output, especially with V_+ near 7.5V.

FIGURE 2. Operation without External Transistor.

LOOP POWER SUPPLY

The voltage applied to the XTR106, V_+ , is measured with respect to the I_O connection, pin 7. V_+ can range from 7.5V to 36V. The loop supply voltage, V_{PS} , will differ from the voltage applied to the XTR106 according to the voltage drop on the current sensing resistor, R_L (plus any other voltage drop in the line).

If a low loop supply voltage is used, R_L (including the loop wiring resistance) must be made a relatively low value to assure that V_+ remains 7.5V or greater for the maximum loop current of 20mA:

$$R_L \text{ max} = \left(\frac{(V_+) - 7.5V}{20mA} \right) - R_{WIRING} \quad (2)$$

It is recommended to design for V_+ equal or greater than 7.5V with loop currents up to 30mA to allow for out-of-range input conditions. V_+ must be at least 8V if 5V sensor excitation is used and if correcting for bridge nonlinearity greater than +3%.

The low operating voltage (7.5V) of the XTR106 allows operation directly from personal computer power supplies ($12V \pm 5\%$). When used with the RCV420 Current Loop Receiver (Figure 8), load resistor voltage drop is limited to 3V.

BRIDGE BALANCE

Figure 1 shows a bridge trim circuit (R_1, R_2). This adjustment can be used to compensate for the initial accuracy of the bridge and/or to trim the offset voltage of the XTR106. The values of R_1 and R_2 depend on the impedance of the bridge, and the trim range required. This trim circuit places an additional load on the V_{REF} output. Be sure the additional load on V_{REF} does not affect zero output. See the Typical Performance Curve, "Under-Scale Current vs $I_{REF} + I_{REG}$." The effective load of the trim circuit is nearly equal to R_2 . An approximate value for R_1 can be calculated:

$$R_1 \approx \frac{5V \cdot R_B}{4 \cdot V_{TRIM}} \quad (3)$$

where, R_B is the resistance of the bridge.

V_{TRIM} is the desired \pm voltage trim range (in V).

Make R_2 equal or lower in value to R_1 .

LINEARIZATION

Many bridge sensors are inherently nonlinear. With the addition of one external resistor, it is possible to compensate for parabolic nonlinearity resulting in up to 20:1 improvement over an uncompensated bridge output.

Linearity correction is accomplished by varying the bridge excitation voltage. Signal-dependent variation of the bridge excitation voltage adds a second-order term to the overall transfer function (including the bridge). This can be tailored to correct for bridge sensor nonlinearity.

Either positive or negative bridge non-linearity errors can be compensated by proper connection of the Lin Polarity pin. To correct for positive bridge nonlinearity (upward bowing), Lin Polarity (pin 12) should be connected to I_{RET} (pin 6) as shown in Figure 3a. This causes V_{REF} to increase with bridge output which compensates for a positive bow in the bridge response. To correct negative nonlinearity (downward bowing), connect Lin Polarity to V_{REG} (pin 1) as shown in Figure 3b. This causes V_{REF} to decrease with bridge output. The Lin Polarity pin is a high impedance node.

If no linearity correction is desired, both the R_{LIN} and Lin Polarity pins should be connected to V_{REG} (Figure 3c). This results in a constant reference voltage independent of input signal. **R_{LIN} or Lin Polarity pins should not be left open or connected to another potential.**

R_{LIN} is the external linearization resistor and is connected between pin 11 and pin 1 (V_{REG}) as shown in Figures 3a and 3b. To determine the value of R_{LIN} , the nonlinearity of the bridge sensor with constant excitation voltage must be known. The XTR106's linearity circuitry can only compensate for the parabolic-shaped portions of a sensor's nonlinearity. Optimum correction occurs when maximum deviation from linear output occurs at mid-scale (see Figure 4). Sensors with nonlinearity curves similar to that shown in

Figure 4, but not peaking exactly at mid-scale can be substantially improved. A sensor with a “S-shaped” nonlinearity curve (equal positive and negative nonlinearity) cannot be improved with the XTR106’s correction circuitry. The value of R_{LIN} is chosen according to Equation 4 shown in Figure 3. R_{LIN} is dependent on a linearization factor, K_{LIN} , which differs for the 2.5V reference and 5V reference. The sensor’s nonlinearity term, B (relative to full scale), is positive or negative depending on the direction of the bow.

A maximum $\pm 5\%$ non-linearity can be corrected when the 5V reference is used. Sensor nonlinearity of $+5\%/-2.5\%$ can be corrected with 2.5V excitation. The trim circuit shown in Figure 3d can be used for bridges with unknown bridge nonlinearity polarity.

Gain is affected by the varying excitation voltage used to correct bridge nonlinearity. The corrected value of the gain resistor is calculated from Equation 5 given in Figure 3.

FIGURE 3. Connections and Equations to Correct Positive and Negative Bridge Nonlinearity.

When using linearity correction, care should be taken to insure that the sensor's output common-mode voltage remains within the XTR106's allowable input range of 1.1V to 3.5V. Equation 6 in Figure 3 can be used to calculate the XTR106's new excitation voltage. The common-mode voltage of the bridge output is simply half this value if no common-mode resistor is used (refer to the example in Figure 3). Exceeding the common-mode range may yield unpredictable results.

For high precision applications (errors < 1%), a two-step calibration process can be employed. First, the nonlinearity of the sensor bridge is measured with the initial gain resistor and $R_{LIN} = 0$ (R_{LIN} pin connected directly to V_{REG}). Using the resulting sensor nonlinearity, B , values for R_G and R_{LIN} are calculated using Equations 4 and 5 from Figure 3. A second calibration measurement is then taken to adjust R_G to account for the offsets and mismatches in the linearization.

UNDER-SCALE CURRENT

The total current being drawn from the V_{REF} and V_{REG} voltage sources, as well as temperature, affect the XTR106's under-scale current value (see the Typical Performance Curve, "Under-Scale Current vs $I_{REF} + I_{REG}$ "). This should be considered when choosing the bridge resistance and excitation voltage, especially for transducers operating over a wide temperature range (see the Typical Performance Curve, "Under-Scale Current vs Temperature").

LOW IMPEDANCE BRIDGES

The XTR106's two available excitation voltages (2.5V and 5V) allow the use of a wide variety of bridge values. Bridge impedances as low as $1k\Omega$ can be used without any additional circuitry. Lower impedance bridges can be used with the XTR106 by adding a series resistance to limit excitation current to $\leq 2.5mA$ (Figure 5). Resistance should be added

FIGURE 4. Parabolic Nonlinearity.

FIGURE 5. 350Ω Bridge with x50 Preamplifier.

to the upper and lower sides of the bridge to keep the bridge output within the 1.1V to 3.5V common-mode input range. Bridge output is reduced so a preamplifier as shown may be needed to reduce offset voltage and drift.

OTHER SENSOR TYPES

The XTR106 can be used with a wide variety of inputs. Its high input impedance instrumentation amplifier is versatile and can be configured for differential input voltages from millivolts to a maximum of 2.4V full scale. The linear range of the inputs is from 1.1V to 3.5V, referenced to the I_{RET} terminal, pin 6. The linearization feature of the XTR106 can be used with any sensor whose output is ratiometric with an excitation voltage.

ERROR ANALYSIS

Table I shows how to calculate the effect various error sources have on circuit accuracy. A sample error calculation for a typical bridge sensor measurement circuit is shown (5kΩ bridge, V_{REF} = 5V, V_{FS} = 50mV) is provided. The results reveal the XTR106's excellent accuracy, in this case 1.2% unadjusted. Adjusting gain and offset errors improves circuit accuracy to 0.33%. Note that these are worst-case errors; guaranteed maximum values were used in the calculations and all errors were assumed to be positive (additive). The XTR106 achieves performance which is difficult to obtain with discrete circuitry and requires less board space.

SAMPLE ERROR CALCULATION

TABLE I. Error Calculation.

REVERSE-VOLTAGE PROTECTION

The XTR106's low compliance rating (7.5V) permits the use of various voltage protection methods without compromising operating range. Figure 6 shows a diode bridge circuit which allows normal operation even when the voltage connection lines are reversed. The bridge causes a two diode drop (approximately 1.4V) loss in loop supply voltage. This results in a compliance voltage of approximately 9V—satisfactory for most applications. A diode can be inserted in series with the loop supply voltage and the V+ pin as shown in Figure 8 to protect against reverse output connection lines with only a 0.7V loss in loop supply voltage.

OVER-VOLTAGE SURGE PROTECTION

Remote connections to current transmitters can sometimes be subjected to voltage surges. It is prudent to limit the maximum surge voltage applied to the XTR106 to as low as practical. Various zener diode and surge clamping diodes are specially designed for this purpose. Select a clamp diode with as low a voltage rating as possible for best protection. For example, a 36V protection diode will assure proper transmitter operation at normal loop voltages, yet will provide an appropriate level of protection against voltage surges. Characterization tests on three production lots showed no damage to the XTR106 with loop supply voltages up to 65V.

Most surge protection zener diodes have a diode characteristic in the forward direction that will conduct excessive current, possibly damaging receiving-side circuitry if the loop connections are reversed. If a surge protection diode is used, a series diode or diode bridge should be used for protection against reversed connections.

RADIO FREQUENCY INTERFERENCE

The long wire lengths of current loops invite radio frequency interference. RF can be rectified by the sensitive input circuitry of the XTR106 causing errors. This generally appears as an unstable output current that varies with the position of loop supply or input wiring.

If the bridge sensor is remotely located, the interference may enter at the input terminals. For integrated transmitter assemblies with short connection to the sensor, the interference more likely comes from the current loop connections.

Bypass capacitors on the input reduce or eliminate this input interference. Connect these bypass capacitors to the I_{RET} terminal as shown in Figure 6. Although the dc voltage at the I_{RET} terminal is not equal to 0V (at the loop supply, V_{PS}) this circuit point can be considered the transmitter's "ground." The 0.01μF capacitor connected between V+ and I_O may help minimize output interference.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

- (3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
- (4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- (5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
- (6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant

PLASTIC DUAL-IN-LINE PACKAGE

16 PINS SHOWN

- NOTES:
- A. All linear dimensions are in inches (millimeters).
 - B. This drawing is subject to change without notice.
 - Falls within JEDEC MS-001, except 18 and 20 pin minimum body length (Dim A).
 - The 20 pin end lead shoulder width is a vendor option, either half or full width.

D (R-PDSO-G14)

PLASTIC SMALL OUTLINE

4040047-5/M 06/11

- NOTES:
- A. All linear dimensions are in inches (millimeters).
 - B. This drawing is subject to change without notice.
 - ΔC Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.006 (0,15) each side.
 - ΔD Body width does not include interlead flash. Interlead flash shall not exceed 0.017 (0,43) each side.
 - E. Reference JEDEC MS-012 variation AB.

D (R-PDSO-G14)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Publication IPC-7351 is recommended for alternate designs.
 - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
