

LMP9007x/LMP90080 Sensor AFE System: Multi-Channel, Low-Power 16-Bit Sensor AFE With True Continuous Background Calibration

1 Features

- 16-Bit Low-Power Sigma Delta ADC
- True Continuous Background Calibration at All Gains
- In-Place System Calibration Using Expected Value Programming
- Low-Noise Programmable Gain (1x - 128x)
- Continuous Background Open/Short and Out of Range Sensor Diagnostics
- 8 Output Data Rates (ODR) with Single-Cycle Settling
- 2 Matched Excitation Current Sources from 100 μ A to 1000 μ A (LMP90080/LMP90078)
- 4-DIFF / 7-SE Inputs (LMP90080/LMP90079)
- 2-DIFF / 4-SE Inputs (LMP90078/LMP90077)
- 7 General Purpose Input/Output Pins
- Chopper-Stabilized Buffer for Low Offset
- SPI 4/3-Wire with CRC Data Link Error Detection
- 50 Hz to 60 Hz Line Rejection at ODR \leq 13.42 SPS
- Independent Gain and ODR Selection per Channel
- Supported by WEBENCH[®] Sensor AFE Designer
- Automatic Channel Sequencer

Key Specifications

- ENOB/NFR: Up to 16/16 Bits
- Offset Error (typ): 8.4 nV
- Gain Error (typ): 7 ppm
- Total Noise: <10 μ V-rms

- Integral Non-Linearity (INL Max): \pm 1 LSB
- Output Data Rates (ODR): 1.6775–214.65 SPS
- Analog Voltage, V_A : 2.85 to 5.5 V
- Operating Temp Range: -40° C to 125° C
- Package: 28 Pin Exposed Pad

2 Applications

- Temperature and Pressure Transmitters
- Strain Gauge Interface
- Industrial Process Control

3 Description

The LLMP9007x and LMP90080 are highly integrated, multi-channel, low-power 16-bit Sensor AFEs. The devices feature a precision, 16-bit Sigma Delta Analog-to-Digital Converter (ADC) with a low-noise programmable gain amplifier and a fully differential high impedance analog input multiplexer. A true continuous background calibration feature allows calibration at all gains and output data rates without interrupting the signal path. The background calibration feature essentially eliminates gain and offset errors across temperature and time, providing measurement accuracy without sacrificing speed and power consumption.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LMP90077	HTSSOP (28)	9.70 mm x 4.40 mm
LMP90078		
LMP90079		
LMP90080		

(1) For all available packages, see the orderable addendum at the end of the datasheet.

Typical Sensor Application

Product	Channel Configuration	Current Sources
LMP90080	4 Differential/7 Single-Ended	Yes
LMP90079	4 Differential/7 Single-Ended	No
LMP90078	2 Differential/4 Single-Ended	Yes
LMP90077	2 Differential/4 Single-Ended	No

4 Revision History

Changes from Revision G (January 2015) to Revision H	Page
• Changed Buffer Enable/Disable	48
• Changed BUF_EN = 1 to 0.	53

Changes from Revision F (March 2013) to Revision G	Page
• Added <i>Pin Configuration and Functions</i> section, <i>ESD Ratings</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section	1
• Added footnote to INL, GE, and Crosstalk specifications.	6
• Changed t_{DOD1} specification.	11
• Deleted CH_STS and ADC_DOUTM from Compute the CRC... sentence.....	38
• Added sentence to the end of the RESET and RESTART section.....	39

Changes from Revision E (March 2013) to Revision F	Page
• Changed layout of National Data Sheet to TI format	52

5 Description (continued)

Another feature of the LMP9007x and LMP90080 is continuous background sensor diagnostics, allowing the detection of open and short circuit conditions and out-of-range signals, without requiring user intervention, resulting in enhanced system reliability.

Two sets of independent external reference voltage pins allow multiple ratiometric measurements. In addition, two matched programmable current sources are available in the LMP90080/LMP90078 to excite external sensors such as resistive temperature detectors and bridge sensors. Furthermore, seven GPIO pins are provided for interfacing to external LEDs and switches to simplify control across an isolation barrier.

Collectively, these features make the LMP90080/LMP90079/LMP90078/LMP90077 complete analog front-ends for low-power, precision sensor applications such as temperature, pressure, strain gauge, and industrial process control. The LMP90080/LMP90079/LMP90078/LMP90077 are ensured over the extended temperature range of -40°C to +125°C and are available in a 28-pin package with an exposed pad.

6 Device Comparison Table

LM90xxx 16-BIT SENOR AFE FAMILY OF PRODUCTS		
DEVICE NUMBER	CHANNEL CONFIGURATION	CURRENT SOURCES
LMP90080	4 Differential/7 Single-Ended	Yes
LMP90079		
LMP90078	2 Differential/4 Single-Ended	
LMP90077		

7 Pin Configuration and Functions

Pin Functions

NAME	PIN				TYPE	FUNCTION
	LMP90080 PIN NO.	LMP90079 PIN NO.	LMP90078 PIN NO.	LMP90077 PIN NO.		
VA	1	1	1	1	Analog Supply	Analog power supply pin
VIN0	2	2	2	2	Analog Input	Analog input pins
VIN1	3	3	3	3		
VIN2	4	4	4	4

Thermal Pad	—	—	—	—	—	Leave the thermal pad floating

8 Specifications

8.1 Absolute Maximum Ratings

See ⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾.

	MIN	MAX	UNIT
Analog Supply Voltage, VA	−0.3	6.0	V
Digital I/O Supply Voltage, VIO	−0.3	6.0	
Reference Voltage, VREF	−0.3	VA+0.3	
Voltage on Any Analog Input Pin to GND ⁽⁵⁾	−0.3	VA+0.3	
Voltage on Any Digital Input PIN to GND ⁽⁵⁾	−0.3	VIO+0.3	
Voltage on SDO ⁽⁵⁾	−0.3	VIO+0.3	
Input Current at Any Pin ⁽⁵⁾		5	mA
Output Current Source or Sink by SDO		5	
Total Package Input and Output Current		20	
Junction Temperature (T _{JMAX})		150	°C
Storage Temperature (T _{stg})	−65	150	°C

- (1) All voltages are measured with respect to GND, unless otherwise specified
- (2) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (3) For soldering specifications see product folder at <http://www.ti.com> and <http://www.ti.com/lit/SNOA549>
- (4) If Military/Aerospace specified devices are required, contact the Texas Instruments Sales Office/ Distributors for availability and specifications.
- (5) When the input voltage (VIN) exceeds the power supply (VIN < GND or VIN > VA), the current at that pin must be limited to 5mA and VIN has to be within the Absolute Maximum Rating for that pin. The 20 mA package input current rating limits the number of pins that can safely exceed the power supplies with current flow to four pins.

8.2 ESD Ratings

	VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2500
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1250
	Machine models (MM)	±200

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

8.3 Recommended Operating Conditions

	MIN	MAX	UNIT
Analog Supply Voltage, V _A	2.85	5.5	V
Digital I/O Supply Voltage, V _{IO}	2.7	5.5	
Full Scale Input Range, V _{IN}	±VREF / PGA		
Reference Voltage, VREF	0.5	VA	
Temperature Range for Electrical Characteristics	−40	125	°C
Operating Temperature Range	−40	125	
Junction to Ambient Thermal Resistance (R _{θJA}) ⁽¹⁾		41	°C/W

(1) The maximum power dissipation is a function of T_{J(MAX)} AND R_{θJA}. The maximum allowable power dissipation at any ambient temperature is P_D = (T_{J(MAX)} - T_A) / R_{θJA}.

8.4 Thermal Information

THERMAL METRIC ⁽¹⁾		LMP900xx	UNIT
		HTSSOP (28 PINS)	
R _{θJA}	Junction-to-ambient thermal resistance	41	°C/W

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, SPRA953.

8.5 Electrical Characteristics

Unless otherwise noted, the key for the condition is (V_A = V_{IO} = VREF) / ODR (SPS) / buffer / calibration / gain . The typical values apply for T_A = +25°C.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT	
n	Resolution		16		Bits	
ENOB / NFR	Effective Number of Bits and Noise Free Resolution	3V / all / ON / OFF / all. Shorted input.	See Table 1		Bits	
		5V / all / ON / OFF / all. Shorted input.	See Table 3		Bits	
ODR	Output Data Rates	1.6675	See Table 1	214.6	SPS	
	Gain	FGA × PGA	1	See Table 3	128	
INL	Integral Non-Linearity ⁽¹⁾	3V / 214.65 / ON / ON / 1	−1	± 0.5	+1	LSB
		3V & 5V / 214.65 / ON / ON / 16		± 1		LSB
	Total Noise	3V / all / ON / ON / all. Shorted input.	See Table 2		μV	
		5V / all / ON / OFF / all. Shorted input.	See Table 4		μV	
OE	Offset Error	3V & 5V / all / ON or OFF / ON / all	Below Noise Floor (rms)		μV	
		3V / 214.65 / ON / ON / 1	1.22	9.52	μV	
		3V / 214.65 / ON / ON / 128	0.00838	0.70	μV	
		5V / 214.65 / ON / ON / 1	1.79	8.25	μV	
		5V / 214.65 / ON / ON / 128	0.0112	0.63	μV	
	Offset Drift Over Temp ⁽¹⁾	3V & 5V / 214.65 / ON or OFF/OFF/1-8	100		nV/°C	
		3V & 5V / 214.65 / ON / ON / 1-8	3		nV/°C	
		3V & 5V / 214.65 / ON / OFF / 16	25		nV/°C	
		3V & 5V / 214.65 / ON / ON / 16	0.4		nV/°C	
		3V & 5V / 214.65 / ON / OFF / 128	6		nV/°C	
		3V & 5V / 214.65 / ON / ON / 128	0.125		nV/°C	
	Offset Drift over Time ⁽¹⁾	5V / 214.65 / ON / OFF / 1, T _A = 150°C	2360		nV/1000 hours	
		5V / 214.65 / ON / ON / 1, T _A = 150°C	100		nV/1000 hours	
GE	Gain Error ⁽¹⁾	3V & 5V / 214.65 / ON / ON / 1, T _{MIN} ≤ T _A ≤ T _{MAX}	−80	80	ppm	
		3V & 5V / 214.65 / ON / ON / 1	7		ppm	
		3V & 5V / 13.42 / ON / ON / 16	50		ppm	
		3V & 5V / 13.42 / ON / ON / 64	50		ppm	
		3V & 5V / 13.42 / ON / ON / 128	100		ppm	
	Gain Drift over Temp ⁽¹⁾	3V & 5V / 214.65 / ON / ON / all	0.5		ppm/°C	

(1) This parameter is specified by design and/or characterization and is not tested in production.

Electrical Characteristics (continued)

Unless otherwise noted, the key for the condition is (VA = VIO = VREF) / ODR (SPS) / buffer / calibration / gain . The typical values apply for $T_A = +25^\circ\text{C}$.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Gain Drift over Time ⁽¹⁾		5V / 214.65 / ON / OFF / 1, $T_A = 150^\circ\text{C}$		5.9		ppm/1000 hours

9 Detailed Description

9.1 Overview

Throughout this datasheet, the LMP90080/LMP90079/LMP90078/LMP90077 will be referred to as the LMP900xx.

The LMP900xx is a low-power 16-Bit $\Sigma\Delta$ ADC with 4 fully differential/7 single-ended analog channels for the LMP90080/LMP90079 and 2 full differential/4 single-ended for the LMP90078/LMP90077. Its serial data output is two's complement format. The output data rate (ODR) ranges from 1.6775 SPS to 214.65 SPS.

The serial communication for LMP900xx is SPI, a synchronous serial interface that operates using 4 pins: chip select bar (CSB), serial clock (SCLK), serial data in (SDI), and serial data out / data ready bar (SDO/DRDYB).

True continuous built-in offset and gain background calibration is also available to improve measurement accuracy. Unlike other ADCs, the LMP900xx's background calibration can run without heavily impacting the input signal. This unique technique allows for positive as well as negative gain calibration and is available at all gain settings.

The registers can be found in the [Register Maps](#) section, and a detailed description of the LMP900xx are provided in the following sections.

9.2 Functional Block Diagram

9.3 Feature Description

9.3.1 Calibration

As seen in [Figure 39](#), there are two types of calibration: background calibration and system calibration. These calibrations are further described in the next sections.

Figure 39. Types of Calibration

9.3.1.1 Background Calibration

Background calibration is the process of continuously determining and applying the offset and gain calibration coefficients to the output codes to minimize the LMP900xx's offset and gain errors. Background calibration is a feature built into the LMP900xx and is automatically done by the hardware without interrupting the input signal.

Four differential channels, CH0-CH3, each with its own gain and ODRs, can be calibrated to improve the accuracy.

9.3.1.1.1 Types of Background Calibration:

[Figure 39](#) also shows that there are two types of background calibration:

Type 1: Correction the process of continuously determining and applying the offset and gain calibration coefficients to the output codes to minimize the LMP900xx's offset and gain errors.

This method keeps track of changes in the LMP900xx's gain and offset errors due to changes in the operating condition such as voltage, temperature, or time.

Type 2: Estimation the process of determining and continuously applying the last known offset and gain calibration coefficients to the output codes to minimize the LMP900xx's offset and gain errors.

The last known offset or gain calibration coefficients can come from two sources. The first source is the default coefficient which is pre-determined and burnt in the device's non-volatile memory. The second source is from a previous calibration run of Type 1: Correction.

The benefits of using Type 2 calibration is a higher throughput, lower power consumption, and slightly better noise. The exact savings would depend on the number of channels being scanned, and the ODR and gain of each channel.

9.3.1.1.2 Using Background Calibration:

There are four modes of background calibration, which can be programmed using the BGCALCN bits. They are as follows:

- BgcalMode0: Background Calibration OFF
- BgcalMode1: Offset Correction / Gain Estimation
- BgcalMode2: Offset Correction / Gain Correction. Follow [Figure 40](#) to set other appropriate registers when using this mode.
- BgcalMode3: Offset Estimation / Gain Estimation

Feature Description (continued)

Figure 40. BgcalMode2 Register Settings

If operating in BgcalMode2, four channels (with the same ODR) are being converted, and FGA_BGCAL = 0 (default), then the ODR is reduced by:

1. 0.19% of 1.6775 SPS
2. 0.39% of 3.355 SPS
3. 0.78% of 6.71 SPS
4. 1.54% of 13.42 SPS
5. 3.03% of 26.83125 SPS
6. 5.88% of 53.6625 SPS
7. 11.11% of 107.325 SPS
8. 20% of 214.65 SPS

9.3.1.2 System Calibration

The LMP900xx provides some unique features to support easy system offset and system gain calibrations.

The System Calibration Offset Registers (CHx_SCAL_OFFSET) hold the System Calibration Offset Coefficients in 16-bit, two's complement binary format. The System Calibration Gain Registers (CHx_SCAL_GAIN) hold the System Calibration Gain Coefficient in 16-bit, 1.15, unsigned, fixed-point binary format. For each channel, the System Calibration Offset coefficient is subtracted from the conversion result prior to the division by the System Calibration Gain coefficient.

A data-flow diagram of these coefficients can be seen in [Figure 41](#).

Figure 41. System Calibration Data-Flow Diagram

There are four distinct sets of System Calibration Offset and System Calibration Gain Registers for use with CH0-CH3. CH4-CH6 reuse the registers of CH0-CH2, respectively.

Feature Description (continued)

The LMP900xx provides two system calibration modes that automatically fill the Offset and Gain coefficients for each channel. These modes are the System Calibration Offset Coefficient Determination mode and the System Calibration Gain Coefficient Determination mode. The System Calibration Offset Coefficient Determination mode must be entered prior to the System Calibration Gain Coefficient Determination mode, for each channel.

The system zero-scale condition is a system input condition (sensor loading) for which zero (0x0000) system-calibrated output code is desired. It may not, however, cause a zero input voltage at the input of the ADC.

The system reference-scale condition is usually the system full-scale condition in which the system's input (or sensor's loading) would be full-scale and the desired system-calibrated output code would be 0x8000 (unsigned 16-bit binary). However, system full-scale condition need not cause full-scale input voltage at the input of the ADC.

The system reference-scale condition is not restricted to just the system full-scale condition. In fact, it can be any arbitrary fraction of full-scale (up to 1.25 times) and the desired system-calibrated output code can be any appropriate value (up to 0xA000). The CHx_SCAL_GAIN register must be written with the desired system-calibrated output code (default:0x8000) before entering the System Calibration Gain Coefficient Determination mode. This helps in in-place system calibration.

9.3.1.2.1 System Calibration Offset Coefficient Determination Mode

Below are the detailed procedures for using the System Calibration Offset Coefficient Determination and System Calibration Gain Coefficient Determination modes.

1. Apply system zero-scale condition to the channel (CH0/CH1/CH2/CH3).
2. Enter the System Calibration Offset Coefficient Determination mode by programming 0x1 in the SCALCN register.
3. LMP900xx starts a fresh conversion at the selected output data rate for the selected channel. At the end of the conversion, the CHx_SCAL_OFFSET register is filled-in with the System Calibration Offset coefficient.
4. The System Calibration Offset Coefficient Determination mode is automatically exited.
5. The computed calibration coefficient is accurate only to the effective resolution of the device and will probably contain some noise. The noise factor can be minimized by computing over many times, averaging (externally) and putting the resultant value back into the register. Alternatively, select the output data rate to be 26.83 SPS or 1.67 SPS.

9.3.1.2.2 System Calibration Gain Coefficient Determination Mode

1. Repeat the System Calibration Offset Coefficient Determination to calibrate the System offset for the channel.
2. Apply the system reference-scale condition to the channel CH0/CH1/CH2/CH3.
3. In the CHx_SCAL_GAIN register, program the expected (desired) system-calibrated output code for this condition in 16-bit unsigned format.
4. Enter the System Calibration Gain Coefficient Determination mode by programming 0x3 in the SCALCN register.
5. LMP900xx starts a fresh conversion at the selected output data rate for the channel. At the end of the conversion, the CHx_SCAL_GAIN is filled-in (or overwritten) with the System Calibration Gain coefficient.
6. The System Calibration Gain Coefficient Determination mode is automatically exited.
7. The computed calibration coefficient is accurate only to the effective resolution of the device and will probably contain some noise. The noise factor can be minimized by computing over many times, averaging (externally) and putting the resultant value back into the register. Alternatively, select the output data rate to be 26.83 SPS or 1.67 SPS.

Feature Description (continued)

9.3.1.2.3 Post-Calibration Scaling

LMP900xx allows scaling (multiplication and shifting) for the System Calibrated result. This eases downstream processing, if any. Multiplication is done using the System Calibration Scaling Coefficient in the CHx_SCAL_SCALING register and shifting is done using the System Calibration Bits Selector in the CHx_SCAL_BITS_SELECTOR register.

The System Calibration Bits Selector value should ideally be the logarithm (to the base 2) of the System Calibration Scaling Coefficient value.

There are four distinct sets of System Calibration Scaling and System Calibration Bits Selector Registers for use with CH0-CH3. CH4-CH6 reuse the registers of CH0-CH2, respectively.

A data-flow diagram of these coefficients can be seen in [Figure 42](#).

Figure 42. Post-Calibration Scaling Data-Flow Diagram

9.3.2 True Continuous Background Calibration

The LMP90080/LMP90079/LMP90078/LMP90077 feature a 16-bit $\Sigma\Delta$ core with continuous background calibration to compensate for gain and offset errors in the ADC, virtually eliminating any drift with time and temperature. The calibration is performed in the background without user or ADC input interruption, making it unique in the industry and eliminating down time associated with field calibration required with other solutions. Having this continuous calibration improves performance over the entire life span of the end product.

9.3.3 Continuous Background Sensor Diagnostics

Sensor diagnostics are also performed in the background, without interfering with signal path performance, allowing the detection of sensor shorts, opens, and out-of-range signals, which vastly improves system reliability. In addition, the fully flexible input multiplexer described below allows any input pin to be connected to any ADC input channel providing additional sensor path diagnostic capability.

9.3.4 Flexible Input MUX Channels

The flexible input MUX allows interfacing to a wide range of sensors such as thermocouples, RTDs, thermistors, and bridge sensors. The LMP90080/LMP90079's multiplexer supports 4 differential channels while the LMP90078/LMP90077 supports 2. Each effective input voltage that is digitized is $V_{IN} = V_{INX} - V_{INY}$, where x and y are any input. In addition, the input multiplexer of the LMP90080/LMP90079 also supports 7 single-ended channels (LMP90078/LMP90077 supports 4), where the common ground is any one of the inputs.

9.3.5 Programmable Gain Amplifiers (FGA & PGA)

The LMP90080/LMP90079/LMP90078/LMP90077 contain an internal 16x fixed gain amplifier (FGA) and a 1x, 2x, 4x, or 8x programmable gain amplifier (PGA). This allows accurate gain settings of 1x, 2x, 4x, 8x, 16x, 32x, 64x, or 128x through configuration of internal registers. Having an internal amplifier eliminates the need for external amplifiers that are costly, space consuming, and difficult to calibrate.

9.3.6 Excitation Current Sources (IB1 & IB2) - LMP90080/LMP90078

Two matched internal excitation currents, IB1 and IB2, can be used for sourcing currents to a variety of sensors. The current range is from 100 μ A to 1000 μ A in steps of 100 μ A.

Feature Description (continued)

9.3.7 Signal Path

9.3.7.1 Reference Input (V_{REF})

The differential reference voltage V_{REF} ($V_{REFP} - V_{REFN}$) sets the range for V_{IN} .

The muxed V_{REF} allows the user to choose between V_{REF1} or V_{REF2} for each channel. This selection can be made by programming the V_{REF_SEL} bit in the $CHx_INPUTCN$ registers ($CHx_INPUTCN: V_{REF_SEL}$). The default mode is V_{REF1} . If V_{REF2} is used, then V_{IN6} and V_{IN7} cannot be used as inputs because they share the same pin.

Refer to V_{REF} for V_{REF} applications information.

9.3.7.2 Flexible Input MUX (V_{IN})

LMP900xx provides a flexible input MUX as shown in Figure 43. The input that is digitized is $V_{IN} = V_{INP} - V_{INN}$; where V_{INP} and V_{INN} can be any available input.

The digitized input is also known as a channel, where $CH = V_{IN} = V_{INP} - V_{INN}$. Thus, there are a maximum of 4 differential channels: CH0, CH1, CH2, and CH3 for the LMP90080/LMP90079. The LMP90078/LMP90077 has 2 differential channels: CH0 and CH1 because it does not have the V_{IN3} , V_{IN4} , and V_{IN5} pins.

LMP900xx can also be configured single-ended, where the common ground is any one of the inputs. There are a maximum of 7 single-ended channels: CH0, CH1, CH2, CH3, CH4, CH5, and CH6 for the LMP90080/LMP90079 and 4: CH0, CH1, CH2, CH3 for the LMP90078/LMP90077.

The input MUX can be programmed in the $CHx_INPUTCN$ registers. For example on the LMP90080, to program $CH0 = V_{IN} = V_{IN4} - V_{IN1}$, go to the $CH0_INPUTCN$ register and set:

1. $V_{INP} = 0x4$
2. $V_{INN} = 0x1$

Figure 43. Simplified VIN Circuitry

Feature Description (continued)

9.3.7.3 Selectable Gains (FGA and PGA)

LMP900xx provides two types of gain amplifiers: a fixed gain amplifier (FGA) and a programmable gain amplifier (PGA). FGA has a fixed gain of 16x or it can be bypassed, while the PGA has programmable gain settings of 1x, 2x, 4x, or 8x.

Total gain is defined as FGA x PGA. Thus, LMP900xx provides gain settings of 1x, 2x, 4x, 8x, 16x, 32x, 64x, or 128x with true continuous background calibration.

The gain is channel specific, which means that one channel can have one gain, while another channel can have the same or a different gain.

The gain can be selected by programming the CHx_CONFIG: GAIN_SEL bits.

9.3.7.4 Buffer (BUFF)

There is an internal unity gain buffer that can be included or excluded from the signal path. Including the buffer provides a high input impedance but increases the power consumption.

When gain ≥ 16 , the buffer is automatically included in the signal path. When gain < 16 , including or excluding the buffer from the signal path can be done by programming the CHx_CONFIG: BUF_EN bit.

9.3.7.5 Internal/External CLK Selection

LMP900xx allows two clock options: internal CLK or external CLK (crystal (XTAL) or clock source).

There is an “External Clock Detection” mode, which detects the external XTAL if it is connected to XOUT and XIN. When operating in this mode, the LMP900xx shuts off the internal clock to reduce power consumption. Below is a flow chart to help set the appropriate clock registers.

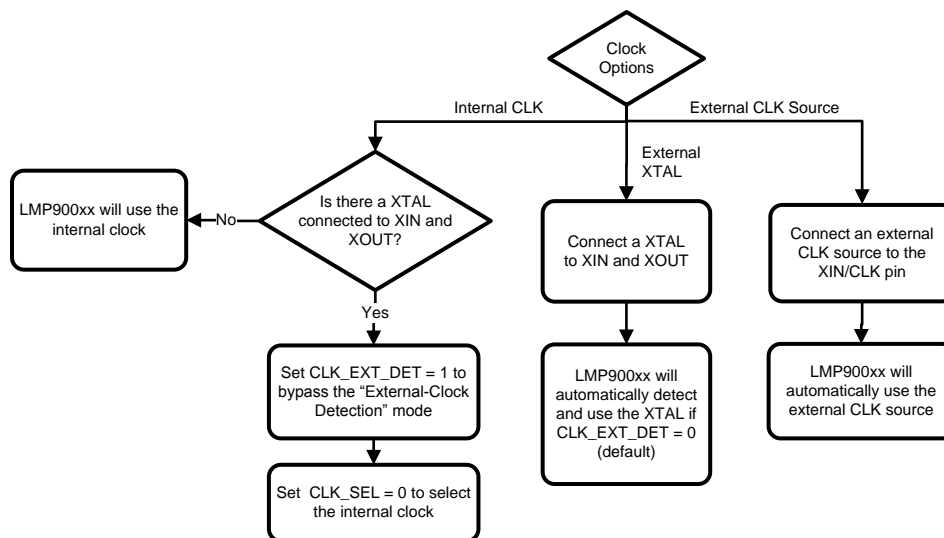

Figure 44. CLK Register Settings

The recommended value for the external CLK is discussed in the next sections.

Feature Description (continued)

9.3.7.6 Programmable ODRS

If using the internal CLK or external CLK of 3.5717 MHz, then the output data rates (ODR) can be selected (using the ODR_SEL bit) as:

1. $13.42/8 = 1.6775$ SPS
2. $13.42/4 = 3.355$ SPS
3. $13.42/2 = 6.71$ SPS
4. 13.42 SPS
5. $214.65/8 = 26.83125$ SPS
6. $214.65/4 = 53.6625$ SPS
7. $214.65/2 = 107.325$ SPS
8. 214.65 SPS (default)

If the internal CLK is not being used and the external CLK is not 3.5717 MHz, then the ODR will be different. If this is the case, use the equation below to calculate the new ODR values.

$$\text{ODR_Base1} = (\text{CLK}_{\text{EXT}}) / (266,240) \tag{1}$$

$$\text{ODR_Base2} = (\text{CLK}_{\text{EXT}}) / (16,640) \tag{2}$$

$$\text{ODR1} = (\text{ODR_Base1}) / n, \text{ where } n = 1,2,4,8 \tag{3}$$

$$\text{ODR2} = (\text{ODR_Base2}) / n, \text{ where } n = 1,2,4,8 \tag{4}$$

For example, a 3.6864 MHz XTAL or external clock has the following ODR values:

$$\text{ODR_Base1} = (3.6864 \text{ MHz}) / (266,240) = 13.85 \text{ SPS} \tag{5}$$

$$\text{ODR_Base2} = (3.6864 \text{ MHz}) / (16,640) = 221.54 \text{ SPS} \tag{6}$$

$$\text{ODR1} = (13.85 \text{ SPS}) / n = 13.85, 6.92, 3.46, 1.73 \text{ SPS} \tag{7}$$

$$\text{ODR2} = (221.54 \text{ SPS}) / n = 221.54, 110.77, 55.38, 27.69 \text{ SPS} \tag{8}$$

The ODR is channel specific, which means that one channel can have one ODR, while another channel can have the same or a different ODR.

Note that these ODRs are meant for a single channel conversion; the ODR needs to be divided by n for n channels scanning. For example, if the ADC were running at 214.65 SPS and four channels are being scanned, then the ODR per channel would be $214.65/4 = 53.6625$ SPS.

9.3.7.7 Digital Filter

The LMP900xx has a fourth order rotated sinc filter that is used to configure various ODRs and to reject power supply frequencies of 50Hz and 60Hz. The 50/60 Hz rejection is only effective when the device is operating at $\text{ODR} \leq 13.42$ SPS. If the internal CLK or the external CLK of 3.5717 MHz is used, then the LMP900xx will have the frequency response shown in [Figure 45](#) through [Figure 49](#).

Feature Description (continued)

If the internal CLK is not being used and the external CLK is not 3.5717 MHz, then the filter response would be the same as the response shown above, but the frequency will change according to the equation:

$$f_{NEW} = [(CLK_{EXT}) / 256] \times (f_{OLD} / 13.952k) \tag{9}$$

Using Equation 9, an example of the filter response for a 3.5717 MHz XTAL versus a 3.6864 MHz XTAL can be seen in Figure 50.

9.3.7.8 GPIO (D0–D6)

Pins D0-D6 are general purpose input/output (GPIO) pins that can be used to control external LEDs or switches. Only a high or low value can be sourced to or read from each pin.

Figure 51 shows a flowchart how these GPIOs can be programmed.

Figure 51. GPIO Register Settings

9.4 Device Functional Modes

9.4.1 Channels Scan Mode

There are four scan modes. These scan modes are selected using the CH_SCAN: CH_SCAN_SEL bit. The first scanned channel is FIRST_CH, and the last scanned channel is LAST_CH; they are both located in the CH_SCAN register.

The CH_SCAN register is double buffered. That is, user inputs are stored in a slave buffer until the start of the next conversion during which time they are transferred to the master buffer. Once the slave buffer is written, subsequent updates are disregarded until a transfer to the master buffer happens. Hence, it may be appropriate to check the CH_SCAN_NRDY bit before programming the CH_SCAN register.

9.4.1.1 ScanMode0: Single-Channel Continuous Conversion

LMP900xx continuously converts the selected FIRST_CH.

Do not operate in this scan mode if gain ≥ 16 and the LMP900xx is running in background calibration modes BgcalMode1 or BgcalMode2. If this is the case, then it is more suitable to operate the device in ScanMode2 instead.

9.4.1.2 ScanMode1: Multiple-Channels Single Scan

LMP900xx converts one or more channels starting from FIRST_CH to LAST_CH, and then enters the stand-by state.

9.4.1.3 ScanMode2: Multiple-Channels Continuous Scan

LMP900xx continuously converts one or more channels starting from FIRST_CH to LAST_CH, and then it repeats this process.

9.4.1.4 ScanMode3: Multiple-Channels Continuous Scan with Burnout Currents

This mode is the same as ScanMode2 except that the burnout current is provided in a serially scanned fashion (injected in a channel after it has undergone a conversion). Thus it avoids burnout current injection from interfering with the conversion result for the channel.

The sensor diagnostic burnout currents are available for all four scan modes. The burnout current is further gated by the BURNOUT_EN bit for each channel. ScanMode3 is the only mode that scans multiple channels while injecting burnout currents without interfering with the signal. This is described in details in [Burnout Currents](#).

9.4.2 Sensor Interface

The LMP90080/LMP90078 contains two excitation currents (IB1 & IB2) for sourcing external sensors, and the LMP900xx contain two burnout currents for sensor diagnostics. They are described in the next sections.

9.4.2.1 IB1 & IB2 - Excitation Currents (LMP90080/LMP90078)

IB1 and IB2 can be used for providing currents to external sensors, such as RTDs or bridge sensors. 100 μ A to 1000 μ A, in steps of 100 μ A, can be sourced by programming the ADC_AUXCN: RTD_CUR_SEL bits.

Refer to [3-Wire RTD](#) to see how IB1 and IB2 can be used to source a 3-wire RTD.

Device Functional Modes (continued)

9.4.2.2 Burnout Currents

As shown in Figure 52, the LMP900xx contains two internal 10 μA burnout current sources, one sourcing current from V_A to V_{INP} , and the other sinking current from V_{INN} to ground. These currents are used for sensor diagnostics and can be enabled for each channel using the CHx_INPUTCN: BURNOUT_EN bit.

Figure 52. Burnout Currents

9.4.2.2.1 Burnout Current Injection

Burnout currents are injected differently depending on the channel scan mode selected.

When $\text{BURNOUT_EN} = 1$ and the device is operating in ScanMode0, 1, or 2, the burnout currents are injected into all the channels for which the BURNOUT_EN bit is selected. This will cause problems and hence in this mode, more than one channel should not have its BURNOUT_EN bit selected. Also, the burnout current will interfere with the signal and introduce a fixed error depending on the particular external sensor.

When $\text{BURNOUT_EN} = 1$ and the device is operating in ScanMode3, burnout currents are injected into the last sampled channel on a cyclical basis (Figure 53). In this mode, burnout currents injection is truly done in the background without affecting the accuracy of the on-going conversion. Operating in this mode is recommended.

Device Functional Modes (continued)

Figure 53. Burnout Currents Injection for Scanmode3

9.4.2.3 Sensor Diagnostic Flags

Burnout currents can be used to verify that an external sensor is still operational before attempting to make measurements on that channel. A non-operational sensor means that there is a possibility the connection between the sensor and the LMP900xx is open circuited, short circuited, shorted to V_A or GND, overloaded, or the reference may be absent. The sensor diagnostic flags diagram can be seen in Figure 54.

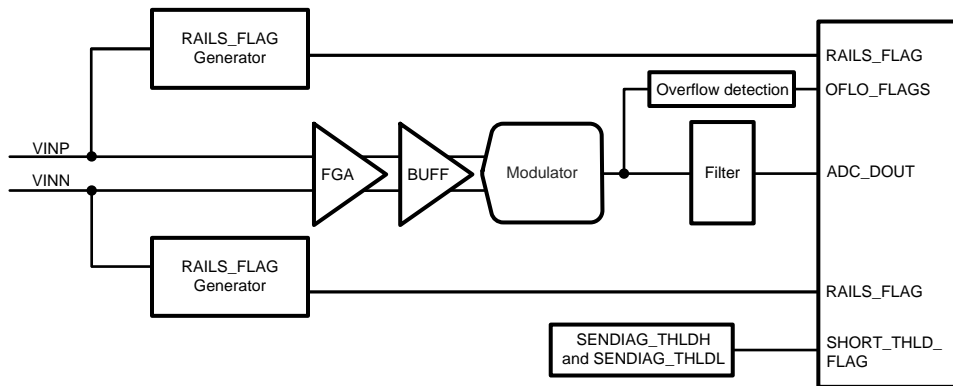

Figure 54. Sensor Diagnostic Flags Diagram

The sensor diagnostic flags are located in the SENDIAG_FLAGS register and are described in further details below.

Device Functional Modes (continued)

9.4.2.3.1 SHORT_THLD_FLAG

The short circuit threshold flag is used to report a short-circuit condition. It is set when the output voltage (V_{OUT}) is within the absolute $V_{threshold}$. $V_{threshold}$ can be programmed using the 8-bit SENDIAG_THLDH register.

For example, assume $V_{REF} = 5V$, gain = 1, SENDIAG_THLD = 0xDA (218d). In this case, $V_{threshold}$ can be calculated as:

$$V_{threshold} = [(SENDIAG_THLD)(2)(V_{REF})] / [(Gain)(2^{16})] \quad (10)$$

$$V_{threshold} = [(218)(2)(5V)] / [(1)(2^{16})] \quad (11)$$

$$V_{threshold} = 33.3 \text{ mV} \quad (12)$$

When $(-33.3\text{mV}) \leq V_{OUT} \leq (33.3\text{mV})$, then SHORT_THLD_FLAG = 1; otherwise, SHORT_THLD_FLAG = 0.

9.4.2.3.2 RAILS_FLAG

The rails flag is used to detect if one of the sampled channels is within 50mV of the rails potential (V_A or V_{SS}). This can be further investigated to detect an open-circuit or short-circuit condition. If the sampled channel is near a rail, then RAILS_FLAG = 1; otherwise, RAILS_FLAG = 0.

9.4.2.3.3 POR_AFT_LST_RD

If POR_AFT_LST_READ = 1, then there was a power-on reset since the last time the SENDIAG_FLAGS register was read. This flag's status is cleared when this bit is read, unless this bit is set again on account of another power-on-reset event in the intervening period.

9.4.2.3.4 OFLO_FLAGS

OFLO_FLAGS is used to indicate whether the modulator is over-ranged or under-ranged. The following conditions are possible:

1. OFLO_FLAGS = 0x0: Normal Operation
2. OFLO_FLAGS = 0x1: The differential input is more than $(\pm V_{REF}/Gain)$ but is not more than $\pm(1.3*V_{REF}/Gain)$ to cause a modulator over-range.
3. OFLO_FLAGS = 0x2: The modulator was over-ranged towards $+V_{REF}/Gain$.
4. OFLO_FLAGS = 0x3: The modulator was over-ranged towards $-V_{REF}/Gain$.

The condition of OFLO_FLAGS = 10b or 11b can be used in conjunction with the RAILS_FLAG to determine the fault condition.

9.4.2.3.5 SAMPLED_CH

These three bits show the channel number for which the ADC_DOUT and SENDIAG_FLAGS are available. This does not necessarily indicate the current channel under conversion because the conversion frame and computation of results from the channels are pipelined. That is, while the conversion is going on for a particular channel, the results for the previous conversion (of the same or a different channel) are available.

9.5 Programming

9.5.1 Serial Digital Interface

A synchronous 4-wire serial peripheral interface (SPI) provides access to the internal registers of LMP900xx via CSB, SCLK, SDI, SDO/DRDYB.

9.5.1.1 Register Address (ADDR)

All registers are memory-mapped. A register address (ADDR) is composed of an upper register address (URA) and lower register address (LRA) as shown in Table 5. For example, ADDR 0x3A has URA=0x3 and LRA=0xA.

Table 5. ADDR Map

BIT	[6:4]	[3:0]
Name	URA	LRA

9.5.1.2 Register Read/Write Protocol

Figure 55 shows the protocol how to write to or read from a register.

Transaction 1 sets up the upper register address (URA) where the user wants to start the register-write or register-read.

Transaction 2 sets the lower register address (LRA) and includes the Data Byte(s), which contains the incoming data from the master or outgoing data from the LMP900xx.

Examples of register-reads or register-writes can be found in [Register Read/Write Examples](#).

Transaction 1 – URA Setup – necessary only when the previous URA is different than the desired URA.

Transaction 2 – Data Access

Figure 55. Register Read/Write Protocol

9.5.1.3 Streaming

When writing/reading 3+ bytes, the user must operate the device in Normal Streaming mode or Controlled Streaming mode. In the Normal Streaming mode, which is the default mode, data runs continuously starting from ADDR until CSB deasserts. This mode is especially useful when programming all the configuration registers in a single transaction. See the [Normal Streaming Example](#) section for an example of the Normal Streaming mode.

In the Controlled Streaming mode, data runs continuously starting from ADDR until the data has run through all (STRM_RANGE + 1) registers. For example, if the starting ADDR is 0x1C, STRM_RANGE = 5, then data will be written to or read from the following ADDRs: 0x1C, 0x1D, 0x1E, 0x1F, 0x20, 0x21. Once the data reaches ADDR 0x21, LMP900xx will wrap back to ADDR 0x1C and repeat this process until CSB deasserts. See the [Controlled Streaming Example](#) section for an example of the Controlled Streaming mode.

If streaming reaches ADDR 0x7F, then it will wrap back to ADDR 0x00. Furthermore, reading back the Upper Register Address after streaming will report the Upper Register Address at the start of streaming, not the Upper Register Address at the end of streaming.

To stream, write 0x3 to INST2's SZ bits as seen in [Figure 55](#). To select the stream type, program the SPI_STREAMCN: STRM_TYPE bit. The STRM_RANGE can also be programmed in the same register.

9.5.1.4 CSB – Chip Select Bar

An SPI transaction begins when the master asserts (active low) CSB and ends when the master deasserts (active high) CSB. Each transaction might be separated by a subsequent one with a CSB deassertion, but this is optional. Once CSB is asserted, it must not pulse (deassert and assert again) during a (desired) transaction.

CSB can be grounded in systems where LMP900xx is the only SPI slave. This frees the software from handling the CSB. Care has to be taken to avoid any false edge on SCLK, and while operating in this mode, the streaming transaction should not be used because exiting from this mode can only be done through a CSB deassertion.

9.5.1.5 SPI Reset

SPI Reset resets the SPI-Protocol State Machine by monitoring the SDI for at least 73 consecutive 1's at each SCLK rising edge. After an SPI Reset, SDI is monitored for a possible Write Instruction at each SCLK rising edge.

SPI Reset will reset the Upper Address Register (URA) to 0, but the register contents are not reset.

By default, SPI reset is disabled, but it can be enabled by writing 0x01 to SPI Reset Register (ADDR 0x02).

9.5.1.6 DRDYB - Data Ready Bar

DRDYB is a signal generated by the LMP900xx that indicates a fresh conversion data is available in the ADC_DOUT registers.

DRDYB is automatically asserted every (1/ODR) second as seen in Figure 56. Before the next assertion, DRDYB will pulse for t_{DRDYB} second. The value for t_{DRDYB} can be found in [Timing Requirements](#).

Figure 56. DRDYB Behavior

If ADC_DOUT is being read while a new ADC_DOUT becomes available, then the ADC_DOUT that is being read is still valid (Figure 57). DRDYB will still be deasserted every 1/ODR second, but a consecutive read on the ADC_DOUT register will fetch the newly converted data available.

Figure 57. DRDYB Behavior For An Incomplete ADC_DOUT Reading

DRDYB can also be accessed via registers using the DT_AVAIL_B bit. This bit indicates when fresh conversion data is available in the ADC_DOUT registers. If new conversion data is available, then DT_AVAIL_B = 0; otherwise, DT_AVAIL_B = 1.

A complete reading for DT_AVAIL_B occurs when the MSB of ADC_DOUTH is read out. This bit cannot be reset even if REG_AND_CNVRST = 0xC3.

9.5.1.6.1 DrdybCase1: Combining SDO/DRDYB with SDO_DRDYB_DRIVER = 0x00

Figure 58. DrdybCase1 Connection Diagram

As shown in Figure 58, the DRDYB signal and SDO can be multiplexed on the same pin as their functions are mostly complementary. In fact, this is the default mode for the SDO/DRDYB pin.

Figure 59 shows a timing protocol for DrdybCase1. In this case, start by asserting CSB first to monitor a DRDYB assertion. When the DRDYB signal asserts, begin writing the Instruction Bytes (INST1, UAB, INST2) to read from or write to registers. Note that INST1 and UAB are omitted from the figure below because this transaction is only required if a new UAB needs to be implemented.

While the CSB is asserted, DRDYB is driving the SDO/DRDYB pin unless the device is reading data, in which case, SDO will be driving the pin. If CSB is deasserted, then the SDO/DRDYB pin is High-Z.

Figure 59. Timing Protocol for DrdybCase1

9.5.1.6.2 DrdybCase2: Combining SDO/DRDYB with SDO_DRDYB_DRIVER = 0x03

SDO/DRDYB can be made independent of CSB by setting SDO_DRDYB_DRIVER = 0x03 in the SPI Handshake Control register. In this case, DRDYB will drive the pin unless the device is reading data, independent of the state of CSB. SDO will drive the pin when CSB is asserted and the device is reading data.

With this scheme, one can use SDO/DRDYB as a true interrupt source, independent of the state of CSB. But this scheme can only be used when the LMP900xx is the only device connected to the master's SPI bus because the SDO/DRDYB pin will be DRDYB even when CSB is deasserted.

The timing protocol for this case can be seen in Figure 60. When DRDYB asserts, assert CSB to start the SPI transaction and begin writing the Instruction Bytes (INST1, UAB, INST2) to read from or write to registers.

Figure 60. Timing Protocol For DrdybCase2

9.5.1.6.3 DrdybCase3: Routing DRDYB to D6

Figure 61. DrdybCase3 Connection Diagram

The DRDYB signal can be routed to pin D6 by setting SPI_DRDYB_D6 high and SDO_DRDYB_DRIVER to 0x4. This is the behavior for DrdybCase3 as shown in [Figure 61](#).

The timing protocol for this case can be seen in [Figure 62](#). Since DRDYB is separated from SDO, it can be monitored using the interrupt or polling method. If polled, the DRDYB signal needs to be polled faster than t_{DRDYB} to detect a DRDYB assertion. When DRDYB asserts, assert CSB to start the SPI transaction and begin writing the Instruction Bytes (INST1, UAB, INST2) to read from or write to registers.

Figure 62. Timing Protocol for DrdybCase3

9.5.1.7 Data Only Read Transaction

In a data only read transaction, one can directly access the data byte(s) as soon as the CSB is asserted without having to send any instruction byte. This is useful as it brings down the latency as well as the overhead associated with the instruction byte (as well as the Upper Address Byte, if any).

In order to use the data only transaction, the device must be placed in the data first mode. The following table lists transaction formats for placing the device in and out of the data first mode and reading the mode status.

Table 6. Data First Mode Transactions

	BIT[7]	BITS[6:5]	BIT[4]	BITS[3:0]	DATA BYTES
Enable Data First Mode Instruction	1	11	1	1010	None
Disable Data First Mode Instruction	1	11	1	1011	None
Read Mode Status Transaction	1	00	1	1111	One

Note that while being in the data first mode, once the data bytes in the data only read transaction are sent out, the device is ready to start on any normal (non-data-only) transaction including the Disable Data First Mode Instruction. The current status of the data first mode (enabled/disabled status) can be read back using the Read Mode Status Transaction. This transaction consists of the Read Mode Status Instruction followed by a single data byte (driven by the device). The data first mode status is available on bit [1] of this data byte.

The data only read transaction allows reading up to eight consecutive registers, starting from any start address. Usually, the start address will be the address of the most significant byte of conversion data, but it could just as well be any other address. The start address and number of bytes to be read during the data only read transaction can be programmed using the DATA_ONLY_1 AND DATA_ONLY_2 registers respectively.

The upper register address is unaffected by a data only read transaction. That is, it retains its setting even after encountering a data only transaction. The data only transaction uses its own address (including the upper address) from the DATA_ONLY_1 register. When in the data first mode, the SCLK must stop high before entering the Data Only Read Transaction; this transaction should be completed before the next scheduled DRDYB deassertion.

9.5.1.8 Cyclic Redundancy Check (CRC)

CRC can be used to ensure integrity of data read from LMP900xx. To enable CRC, set EN_CRC high. Once CRC is enabled, the CRC value is calculated and stored in SPI_CRC_DAT so that the master device can periodically read for data comparison. The CRC is automatically reset when CSB or DRDYB is deasserted.

The CRC polynomial is $x^8 + x^5 + x^4 + 1$. The reset value of the SPI_CRC_DAT register is zero, and the final value is ones-complemented before it is sent out. Note that CRC computation only includes the bits sent out on SDO and does not include the bits of the SPI_CRC_DAT itself; thus it is okay to read SPI_CRC_DAT repeatedly.

The DRDYB signal normally deasserts (active high) every 1/ODR second. However, this behavior can be changed so that DRDYB deassertion can occur after SPI_CRC_DAT is read, but not later than normal DRDYB deassertion which occurs at every 1/ODR seconds. This is done by setting bit DRDYB_AFT_CRC high.

The timing protocol for CRC can be found in [Figure 63](#).

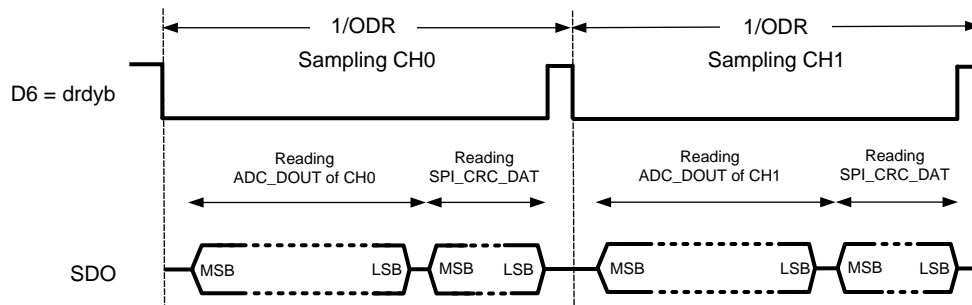

Figure 63. Timing Protocol for Reading SPI_CRC_DAT

If SPI_CRC_DAT read extends beyond the normal DRDYB deassertion at every 1/ODR seconds, then CRC_RST has to be set in the SPI Data Ready Bar Control Register. This is done to avoid a CRC reset at the DRDYB deassertion. Timing protocol for reading CRC with CRC_RST set is shown in [Figure 64](#).

Figure 64. Timing Protocol for Reading SPI_CRC_DAT Beyond Normal DRDYB Deassertion at Every 1/ODR Seconds

Follow the steps below to enable CRC:

1. Set SPI_CRC_CN = 1 (register 0x13, bit 4) to enable CRC.
2. Set DRDYB_AFT_CRC = 1 (register 0x13, bit 2) to deassert the DRDYB after CRC.
3. Compute the CRC externally, which should include ADC_DOUTH and ADC_DOUTL.
4. Collect the data and verify the reported CRC matches with the computed CRC (step above).

9.5.2 RESET and RESTART

Writing 0xC3 to the REG_AND_CNV_RST field will reset the conversion and most of the programmable registers to their default values. The only registers that will not be reset are the System Calibration Registers (CHx_SCAL_OFFSET, CHx_SCAL_GAIN) and the DT_AVAIL_B bit.

If it is desirable to reset the System Calibration Coefficient Registers, then set RESET_SYSCAL = 1 before writing 0xC3 to REG_AND_CNV_RST. If the device is operating in the “System Calibration Offset/Gain Coefficient Determination” mode (SCALCN register), then write REG_AND_CNV_RST = 0xC3 twice to get out of this mode.

After a register reset, any on-going conversions will be aborted and restarted. If the device is in the power-down state, then a register reset will bring it out of the power-down state.

To restart a conversion, write 1 to the RESTART bit. This bit can be used to synchronize the conversion to an external event.

After a restart conversion, the first sample is not valid. To restart with a valid first sample, issue a stand-by command followed by an active command.

9.5.3 Register Read/Write Examples

9.5.3.1 Writing to Register Examples

Using the register read/write protocol shown in Figure 55, the following example shows how to write three data bytes starting at register address (ADDR) 0x1F. After the last byte has been written to ADDR 0x21, deassert CSB to end the register-write.

Transaction 1 – URA Setup – necessary only when the previous URA is different than the desired URA.

Transaction 2 – Data Access

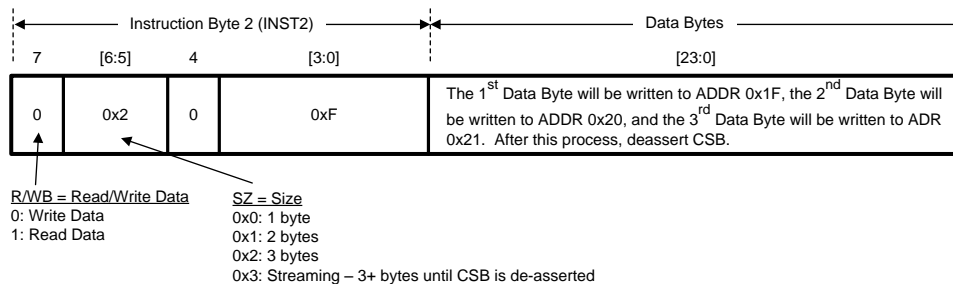

Figure 65. Register-Write Example 1

The next example shows how to write one data byte to ADDR 0x12. Since the URA for this example is the same as the last example, transaction 1 can be omitted.

Transaction 2 – Data Access

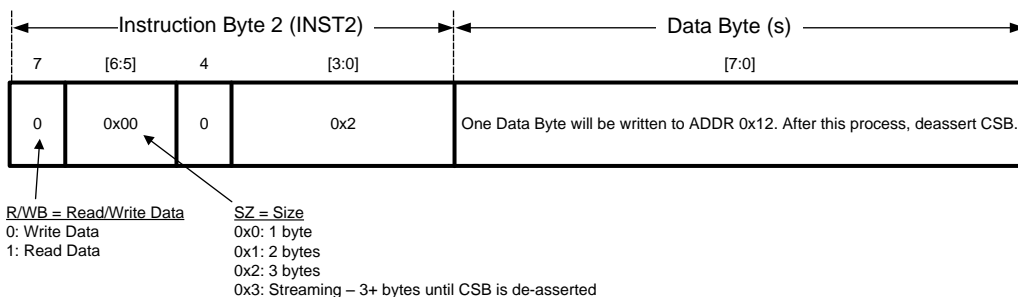

Figure 66. Register-Write Example 2

9.5.3.2 Reading from Register Example

The following example shows how to read two bytes. The first byte will be read from starting ADDR 0x24, and the second byte will be read from ADDR 0x25.

Transaction 1 – URA Setup – necessary only when the previous URA is different than the desired URA.

Transaction 2 – Data Access

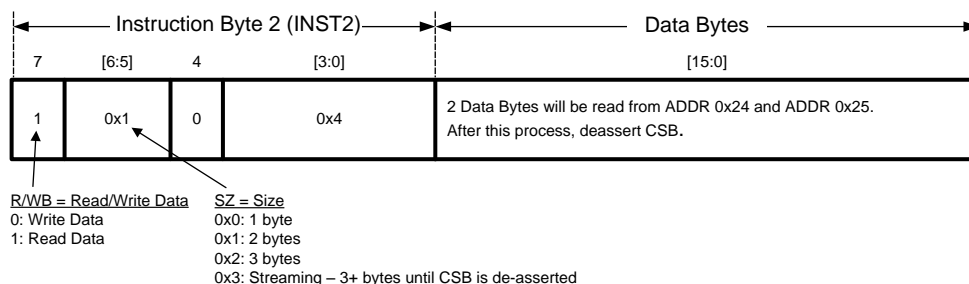

Figure 67. Register-Read Example

9.5.4 Streaming Examples

9.5.4.1 Normal Streaming Example

This example shows how to write six data bytes starting at ADDR 0x28 using the Normal Streaming mode. Because the default STRM_TYPE is the Normal Streaming mode, setting up the SPI_STREAMCN register can be omitted.

Transaction 1 – URA Setup – necessary only when the previous URA is different than the desired URA.

R/WB = Read/Write Address
0x10: Write Address
0x90: Read Address

Transaction 2 – Data Access

R/WB = Read/Write Data SZ = Size
0: Write Data 0x0: 1 byte
1: Read Data 0x1: 2 bytes
 0x2: 3 bytes
 0x3: Streaming – 3+ bytes until CSB is de-asserted

Figure 68. Normal Streaming Example

9.5.4.2 Controlled Streaming Example

This example shows how to read the 16-bit conversion data (ADC_DOUT) four times using the Controlled Streaming mode. The ADC_DOUT registers consist of ADC_DOUTH at ADDR 0x1A and ADC_DOUTL at ADDR 0x1B.

The first step (Figure 69) sets up the SPI_STREAMCN register. This step enters the Controlled Streaming mode by setting STRM_TYPE high in ADDR 0x03. Since two registers (ADDR 0x1A - 0x1B) need to be read, the STRM_RANGE is 1.

Transaction 1 – URA Setup – necessary only when the previous URA is different than the desired URA.

R/WB = Read/Write Address
 0x10: Write Address
 0x90: Read Address

Transaction 2 – Data Access

R/WB = Read/Write Data
 0: Write Data
 1: Read Data

SZ = Size
 0x0: 1 byte
 0x1: 2 bytes
 0x2: 3 bytes
 0x3: Streaming – 3+ bytes until CSB is de-asserted

Figure 69. Setting Up SPI_STREAMCN

The next step shows how to perform the Controlled Streaming mode so that the master device will read ADC_DOUT from ADDR 0x1A and 0x1B, then wrap back to ADDR 0x1A, and repeat this process for four times. After this process, deassert CSB to end the Controlled Streaming mode.

Transaction 1 – URA Setup – necessary only when the previous URA is different than the desired URA.

R/WB = Read/Write Address
 0x10: Write Address
 0x90: Read Address

Transaction 2 – Data Access

R/WB = Read/Write Data
 0: Write Data
 1: Read Data

SZ = Size
 0x0: 1 byte
 0x1: 2 bytes
 0x2: 3 bytes
 0x3: Streaming – 3+ bytes until CSB is de-asserted

Figure 70. Controlled Streaming Example

9.6 Register Maps

1. If written to, RESERVED bits must be written to only 0 unless otherwise indicated.
2. Read back value of RESERVED bits and registers is unspecified and should be discarded.
3. Recommended values must be programmed and forbidden values must not be programmed where they are indicated in order to avoid unexpected results.
4. If written to, registers indicated as Reserved must have the indicated default value as shown below. Any other value can cause unexpected results.

Table 7. Register Map

REGISTER NAME		ADDR (URA & LRA)	TYPE	DEFAULT
RESETCN	Reset Control	0x00	WO	-
SPI_HANDSHAKECN	SPI Handshake Control	0x01	R/W	0x00

9.6.1 Power and Reset Registers
Table 8. RESTCN

RESET CONTROL (ADDRESS 0x00)		
BIT	BIT SYMBOL	BIT DESCRIPTION
[7:0]	REG_AND_CNV_RST	Register and Conversion Reset 0xC3 : Register and conversion reset Others : Neglected

Table 9. SPI_RESET

SPI RESET CONTROL (ADDRESS 0x02)		
BIT	BIT SYMBOL	BIT DESCRIPTION
[0]	SPI_RST	SPI Reset Enable 0x0 (default): SPI Reset Disabled 0x1: SPI Reset Enabled ⁽¹⁾

Table 10. PWRCN

POWER MODE CONTROL AND STATUS (ADDRESS 0x08)		
BIT	BIT SYMBOL	BIT DESCRIPTION
[7:2]	Reserved	-
[1:0]	PWRCN	Power Control Write Only – power down mode control 0x0: Active Mode 0x1: Power-down Mode 0x3: Stand-by Mode Read Only – the present mode is: 0x0 (default): Active Mode 0x1: Power-down Mode 0x3: Stand-by Mode

(1) Once written, the contents of this register are sticky. That is, the content of this register cannot be changed with subsequent write. However, a Register reset clears the register as well as the sticky status.

9.6.2 ADC Registers

Table 11. ADC_RESTART

ADC RESTART CONVERSION (ADDRESS 0x0B)		
BIT	BIT SYMBOL	BIT DESCRIPTION
[7:1]	Reserved	-
0	RESTART	Restart conversion 1: Restart conversion.

Table 12. ADC_AUXCN

ADC AUXILIARY CONTROL (ADDRESS 0x12)		
BIT	BIT SYMBOL	BIT DESCRIPTION
7	Reserved	-
6	RESET_SYSCAL	The System Calibration registers (CHx_SCAL_OFFSET and CHx_SCAL_GAIN) are: 0 (default): preserved even when "REG_AND_CNV_RST" = 0xC3. 1: reset by setting "REG_AND_CNV_RST" = 0xC3.
5	CLK_EXT_DET	External clock detection 0 (default): "External Clock Detection" is operational 1: "External-Clock Detection" is bypassed
4	CLK_SEL	Clock select – only valid if CLK_EXT_DET = 1 0 (default): Selects internal clock 1: Selects external clock

Table 12. ADC_AUXCN (continued)

ADC AUXILIARY CONTROL (ADDRESS 0x12)		
BIT	BIT SYMBOL	BIT DESCRIPTION
[3:0]	RTD_CUR_SEL (LMP90080 and LMP90078 only)	Selects RTD Current as follows: 0x0 (default): 0 μ A 0x1: 100 μ A 0x2: 200 μ A 0x3: 300 μ A 0x4: 400 μ A 0x5: 500 μ A 0x6: 600 μ A 0x7: 700 μ A 0x8: 800 μ A 0x9: 900 μ A 0xA: 1000 μ A

Table 13. ADC_DONE

ADC DATA AVAILABLE (ADDRESS 0x18)		
BIT	BIT SYMBOL	BIT DESCRIPTION
[7:0]	DT_AVAIL_B	Data Available – indicates if new conversion data is available 0x00 – 0xFE: Available 0xFF: Not available

Table 14. ADC_DOUT ⁽¹⁾

16-BIT CONVERSION DATA (TWO'S COMPLEMENT) (ADDRESS 0x1A - 0x1B)		
ADDRESS	NAME	REGISTER DESCRIPTION
0x1A	ADC_DOUTH	ADC Conversion Data [15:8]
0x1B	ADC_DOUTL	ADC Conversion Data [7:0]
0x1C	Reserved	Reserved

(1) Repeat reads of these registers are allowed as long as such reads are spaced apart by at least 72 μ s.

9.6.3 Channel Configuration Registers

Table 15. CH_STS

CHANNEL STATUS (ADDRESS 0x1E)		
BIT	BIT SYMBOL	BIT DESCRIPTION
[7:2]	Reserved	-
1	CH_SCAN_NRDY	Channel Scan Not Ready – indicates if it is okay to program CH_SCAN 0: Update not pending, CH_SCAN register is okay to program 1: Update pending, CH_SCAN register is not ready to be programmed
0	INV_OR_RPT_RD_STS	Invalid or Repeated Read Status 0: ADC_DOUT just read was valid and hitherto unread 1: ADC_DOUT just read was either invalid (not ready) or there was a repeated read.

Table 16. CH_SCAN (1)

CHANNEL SCAN MODE (ADDRESS 0x1F)		
BIT	BIT SYMBOL	BIT DESCRIPTION
[7:6]	CH_SCAN_SEL	Channel Scan Select 0x0 (default): ScanMode0: Single-Channel Continuous Conversion 0x1: ScanMode1: One or more channels Single Scan 0x2: ScanMode2: One or more channels Continuous Scan 0x3: ScanMode3: One or more channels Continuous Scan with Burnout Currents
[5:3]	LAST_CH (CH4 to CH6 for LMP90080 and LMP90079 only)	Last channel for conversion 0x0: CH0 0x1: CH1 0x2: CH2 0x3: CH3 0x4: CH4 0x5: CH5 0x6 (default): CH6 ⁽²⁾
[2:0]	FIRST_CH (CH4 to CH6 for LMP90080 and LMP90079 only)	Starting channel for conversion 0x0 (default): CH0 0x1: CH1 0x2: CH2 0x3: CH3 0x4: CH4 0x5: CH5 0x6: CH6 ⁽³⁾

- (1) While writing to the CH_SCAN register, if 0x7 is written to FIRST_CH or LAST_CH the write to the entire CH_SCAN register is ignored.
- (2) LAST_CH cannot be smaller than FIRST_CH. For example, if LAST_CH = CH5, then FIRST_CH cannot be CH6. If 0x7 is written it is ignored.
- (3) FIRST_CH cannot be greater than LAST_CH. For example, if FIRST_CH = CH1, then LAST_CH cannot be CH0. If 0x7 is written it is ignored.

Table 17. CHx_INPUTCN

Table 19. CHx_CONFIG

CHANNEL CONFIGURATION (CH4 TO CH6 LMP90080/LMP90079 ONLY)		
REGISTER ADDRESS (HEX): CH0: 0x21, CH1: 0x23, CH2: 0x25, CH3: 0x27, CH4: 0x29, CH5: 0x2B, CH6: 0x2D		
BIT	BIT SYMBOL	BIT DESCRIPTION
7	Reserved	-
[6:4]	ODR_SEL	ODR Select 0x0: 13.42 / 8 = 1.6775 SPS 0x1: 13.42 / 4 = 3.355 SPS 0x2: 13.42 / 2 = 6.71 SPS 0x3: 13.42 SPS 0x4: 214.65 / 8 = 26.83125 SPS 0x5: 214.65 / 4 = 53.6625 SPS 0x6: 214.65 / 2 = 107.325 SPS 0x7(default): 214.65 SPS
[3:1]	GAIN_SEL	Gain Select 0x0 (default): 1 (FGA OFF) 0x1: 2 (FGA OFF) 0x2: 4 (FGA OFF) 0x3: 8 (FGA OFF) 0x4: 16 (FGA ON) 0x5: 32 (FGA ON) 0x6: 64 (FGA ON) 0x7: 128 (FGA ON)
0	BUF_EN	Enable/Disable the buffer 0 (default): Exclude the buffer in the signal path 1: Include the buffer from the signal path ⁽¹⁾

(1) When gain \geq 16, the buffer is automatically included in the signal path irrespective of this bit.

9.6.4 Calibration Registers

Table 20. BGCALCN

BACKGROUND CALIBRATION CONTROL (ADDRESS 0x10)		
BIT	BIT SYMBOL	BIT DESCRIPTION
[7:2]	Reserved	-
[1:0]	BGCALN	Background calibration control – selects scheme for continuous background calibration. 0x0 (default): BgcalMode0: Background Calibration OFF 0x1: BgcalMode1: Offset Correction / Gain Estimation 0x2: BgcalMode2: Offset Correction / Gain Correction 0x3: BgcalMode3: Offset Estimation / Gain Estimation

Table 21. SCALCN

SYSTEM CALIBRATION CONTROL (ADDRESS 0x17)		
BIT	BIT SYMBOL	BIT DESCRIPTION
[7:2]	Reserved	-
[1:0]	SCALCN	System Calibration Control When written, set SCALCN to: 0x0 (default): Normal Mode 0x1: "System Calibration Offset Coefficient Determination" mode 0x2: "System Calibration Gain Coefficient Determination" mode 0x3: Reserved When read, this bit indicates the system calibration mode is in: 0x0: Normal Mode 0x1: "System Calibration Offset Coefficient Determination" mode 0x2: "System Calibration Gain Coefficient Determination" mode 0x3: Reserved ⁽¹⁾

(1) When read, this bit will indicate the current System Calibration status. Since this coefficient determination mode will only take 1 conversion cycle, reading this register will only return 0x00, unless this register is read within 1 conversion window.

Table 22. CHx_SCAL_OFFSET

CH0-CH3 SYSTEM CALIBRATION OFFSET REGISTERS (TWO'S-COMPLEMENT)

9.6.5 Sensor Diagnostic Registers

Table 26. SENDIAG_THLD

SENSOR DIAGNOSTIC THRESHOLD (ADDRESS 0x14)		
ADDRESS	NAME	REGISTER DESCRIPTION
0x14	SENDIAG_THLD	Sensor Diagnostic threshold

Table 27. SENDIAG_FLAGS

SENSOR DIAGNOSTIC FLAGS (ADDRESS 0x19)		
BIT	BIT SYMBOL	BIT DESCRIPTION
7	SHORT_THLD_FLAG	Short Circuit Threshold Flag = 1 when the absolute value of VOUT is within the absolute threshold voltage set by the SENDIAG_THLD register.
6	RAILS_FLAG	Rails Flag = 1 when at least one of the inputs is near rail (VA or GND).
5	POR_AFT_LST_RD	Power-on-reset after last read = 1 when there was a power-on-reset event since the last time the SENDIAG_FLAGS register was read.
[4:3]	OFLO_FLAGS	Overflow flags 0x0: Normal operation 0x1: The modulator was not over-ranged, but ADC_DOUT got clamped to 0x7f_ffff (positive fullscale) or 0x80_0000 (negative full scale) 0x2: The modulator was over-ranged (VIN > 1.2*VREF/GAIN) 0x3: The modulator was over-ranged (VIN < -1.2*VREF/GAIN)
[2:0]	SAMPLED_CH	Channel Number – the sampled channel for ADC_DOUT and SENDIAG_FLAGS.

9.6.6 SPI Registers

Table 28. SPI_HANDSHAKECN

SPI HANDSHAKE CONTROL (ADDRESS 0x01)					
BIT	BIT SYMBOL	BIT DESCRIPTION			
[7:4]	Reserved	-			
[3:1]	SDO_DRDYB_DRIVER	SDO/DRDYB Driver – sets who is driving the SDO/DRDYB pin			
			Whenever CSB is Asserted and the Device is Reading ADC_DOUT	Whenever CSB is Asserted and the Device is Not Reading ADC_DOUT	CSB is Deasserted
		0x0 (default)	SDO is driving	DRDYB is driving	High-Z
		0x3	SDO is driving	DRDYB is driving	DRDYB is driving
		0x4	SDO is driving	High-Z	High-Z
	Others	Forbidden			

Table 28. SPI_HANDSHAKECN (continued)

SPI HANDSHAKE CONTROL (ADDRESS 0x01)		
BIT	BIT SYMBOL	BIT DESCRIPTION
0	SW_OFF_TRG	Switch-off trigger - refers to the switching of the output drive from the slave to the master. 0 (default): SDO will be high-Z after the last (16th, 24th, 32nd, etc) rising edge of SCLK. This option allows time for the slave to transfer control back to the master at the end of the frame. 1: SDO's high-Z is postponed to the subsequent falling edge following the last (16th, 24th, 32nd, etc) rising edge of SCLK. This option provides additional hold time for the last bit, DB0, in non-streaming read transfers.

Table 29. SPI_STREAMCN

SPI STREAMING CONTROL (ADDRESS 0x03)		
BIT	BIT SYMBOL	BIT DESCRIPTION
7	STRM_TYPE	Stream type 0 (default): Normal Streaming mode 1: Controlled Streaming mode
[6:0]	STRM_RANGE	Stream Range – selects Range for Controlled Streaming mode Default: 0x00

Table 30. DATA_ONLY_1

DATA ONLY READ CONTROL 1 (ADDRESS 0x09)		
BIT	BIT SYMBOL	BIT DESCRIPTION
7	Reserved	-
[6:0]	DATA_ONLY_ADR	Start address for the Data Only Read Transaction Default: 0x1A Please refer to the description of DT_ONLY_SZ in Table 31 register.

Table 31. DATA_ONLY_2

DATA ONLY READ CONTROL 2 (ADDRESS 0x0A)		
BIT	BIT SYMBOL	BIT DESCRIPTION
[7:3]	Reserved	-
[2:0]	DATA_ONLY_SZ	Number of bytes to be read out in Data Only mode. A value of 0x0 means read one byte and 0x7 means read 8 bytes. Default: 0x2

Table 32. SPI_DRDYBCN

SPI DATA READY BAR CONTROL (ADDRESS 0x11)		
BIT	BIT SYMBOL	BIT DESCRIPTION
7	SPI_DRDYB_D6	Enable DRDYB on D6 0 (default): D6 is a GPIO 1: D6 = DRDYB signal
6	Reserved	-
5	CRC_RST	CRC Reset 0 (default): Enable CRC reset on DRDYB deassertion 1: Disable CRC reset on DRDYB deassertion
4	Reserved	-
3	FGA_BGCAL	Gain background calibration 0 (default): Correct FGA gain error. This is useful only if the device is operating in BgcalMode2 and ScanMode2 or ScanMode3. 1: Correct FGA gain error using the last known coefficients.
[2:0]	Reserved	Default - 0x3 (do not change this value)

Table 33. SPI_CRC_CN

CRC CONTROL (ADDRESS 0x13)		
BIT	BIT SYMBOL	BIT DESCRIPTION
[7:5]	Reserved	-
4	EN_CRC	Enable CRC 0 (default): Disable CRC 1: Enable CRC
3	Reserved	Default - 0x0 (do not change this value)
2	DRDYB_AFT_CRC	DRDYB After CRC 0 (default): DRDYB is deasserted (active high) after ADC_DOUTL is read. 1: DRDYB is deasserted after SPI_CRC_DAT (which follows ADC_DOUTL), is read.
[1:0]	Reserved	-

Table 34. SPI_CRC_DAT

CRC DATA (ADDRESS 0x1D)		
BIT	BIT SYMBOL	BIT DESCRIPTION
[7:0]	CRC_DAT	CRC Data When written, this register reset CRC: Any Value: Reset CRC When read, this register indicates the CRC data.

9.6.7 GPIO Registers

Table 35. GPIO_DIRCN

GPIO DIRECTION (ADDRESS 0x0E)		
BIT	BIT SYMBOL	BIT DESCRIPTION
7	Reserved	-
x	GPIO_DIRCNx	GPIO direction control – these bits are used to control the direction of each General Purpose Input/Outputs (GPIO) pins D0 - D6. 0 (default): Dx is an Input 1: Dx is an Output where $0 \leq x \leq 6$ For example, writing a 1 to bit 6 means D6 is an Output. ⁽¹⁾

(1) If D6 is used for DRDYB, then it cannot be used for GPIO.

Table 36. GPIO_DAT

GPIO DATA (ADDRESS 0x0F)		
BIT	BIT SYMBOL	BIT DESCRIPTION
7	Reserved	-
x	Dx	Write Only - when GPIO_DIRCNx = 0 0: Dx is LO 1: Dx is HI Read Only - when GPIO_DIRCNx = 1 0: Dx driven LO 1: Dx driven HI where $0 \leq x \leq 6$ For example, writing a 0 to bit 4 means D4 is LO. It is okay to Read the GPIOs that are configured as outputs and write to GPIOs that are configured as inputs. Reading the GPIOs that are outputs would return the current value on those GPIOs, and writing to the GPIOs that are inputs are neglected.

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

10.1.1 Connecting the Supplies

10.1.1.1 V_A and V_{IO}

Any ADC architecture is sensitive to spikes on the analog voltage, V_A , digital input/output voltage, V_{IO} , and ground pins. These spikes may originate from switching power supplies, digital logic, high power devices, and other sources. To diminish these spikes, the LMP900xx's V_A and V_{IO} pins should be clean and well bypassed. A 0.1 μF ceramic bypass capacitor and a 1 μF tantalum capacitor should be used to bypass the LMP900xx supplies, with the 0.1 μF capacitor placed as close to the LMP900xx as possible.

Since the LMP900xx has both external V_A and V_{IO} pins, the user has two options on how to connect these pins. The first option is to tie V_A and V_{IO} together and power them with the same power supply. This is the most cost effective way of powering the LMP900xx but is also the least ideal because noise from V_{IO} can couple into V_A and negatively affect performance. The second option involves powering V_A and V_{IO} with separate power supplies. These supply voltages can have the same amplitude or they can be different.

10.1.1.2 V_{REF}

Operation with V_{REF} below V_A is also possible with slightly diminished performance. As V_{REF} is reduced, the range of acceptable analog input voltages is also reduced. Reducing the value of V_{REF} also reduces the size of the LSB. When the LSB size goes below the noise floor of the LMP900xx, the noise will span an increasing number of codes and performance will degrade. For optimal performance, V_{REF} should be the same as V_A and sourced with a clean source that is bypassed with a ceramic capacitor value of 0.1 μF and a tantalum capacitor of 10 μF .

LMP900xx also allows ratiometric connection for noise immunity reasons. A ratiometric connection is when the ADC's V_{REFP} and V_{REFN} are used to excite the input device's (i.e. a bridge sensor) voltage references. This type of connection severely attenuates any V_{REF} ripple seen the ADC output, and is thus strongly recommended.

10.1.2 Quick Start

This section shows step-by-step instructions to configure the LMP900xx to perform a simple DC reading from CH0.

1. Apply $V_A = V_{IO} = V_{REFP1} = 5\text{V}$, and ground V_{REFN1}
2. Apply $V_{INP} = \frac{3}{4}V_{REF}$ and $V_{INN} = \frac{1}{4}V_{REF}$ for CH0. Thus, set $CH0 = V_{IN} = V_{INP} - V_{INN} = \frac{1}{2}V_{REF}$ (CH0_INPUTCN register)
3. Set gain = 1 (CH0_CONFIG: GAIN_SEL = 0x0)
4. Exclude the buffer from the signal path (CH0_CONFIG: BUF_EN = 0)
5. Set the background to BgcalMode2 (BGCALCN = 0x2)
6. Select V_{REF1} (CH0_INPUTCN: $V_{REF_SEL} = 0$)
7. To use the internal CLK, set CLK_EXT_DET = 1 and CLK_SEL = 0.
8. Follow the register read/write protocol ([Figure 55](#)) to capture ADC_DOUT from CH0.

Application Information (continued)

10.1.3 ADC_DOUT Calculation

The output code of the LMP900xx can be calculated as:

$$\text{ADC_DOUT} = \pm \left(\frac{(\text{VINP} - \text{VINN}) \times \text{GAIN}}{\text{VREFP} - \text{VREFN}} \right) \times (2^{15})$$

Output Code

(13)

ADC_DOUT is in 16-bit two's complement binary format. The largest positive value is 0x7FFF (or 32767 in decimal), while the largest negative value is 0x8000 (or 32768 in decimal). In case of an over range the value is automatically clamped to one of these two values.

Figure 71 shows the theoretical output code, ADC_DOUT, vs. analog input voltage, V_{IN}, using the equation above.

Figure 71. ADC_DOUT vs. VIN of a 16-Bit Resolution (VREF = 5.5 V, Gain = 1).

10.2 Typical Applications

10.2.1 Typical Sensor Application

Figure 72. Typical Sensor Application

Typical Applications (continued)

10.2.1.1 Design Requirements

- $V_A = 3\text{ V}$
- $V_{IO} = 3\text{ V}$
- 3-Wire RTD using 2 current sources

10.2.1.2 Detailed Design Procedure

Figure 72 shows the first topology for a 3-wire resistive temperature detector (RTD) application. Topology #1 uses two excitation current sources, IB1 and IB2, to create a differential voltage across VIN0 and VIN1. As a result of using both IB1 and IB2, only one channel (VIN0-VIN1) needs to be measured. As shown in Equation 14, the equation for this channel is $IB1 \times (RTD - R_{COMP})$ assuming that $R_{LINE1} = R_{LINE2}$.

$$VIN0 = IB1 (R_{LINE1} + RTD) + (IB1 + IB2) (R_{LINE3} + R_{REF})$$

$$VIN1 = IB2 (R_{LINE2} + R_{COMP}) + (IB1 + IB2) (R_{LINE3} + R_{REF})$$

If $R_{LINE1} = R_{LINE2}$, then:

$$VIN = (VIN0 - VIN1) = IB1 (RTD - R_{COMP})$$

VIN Equation for Topology #1

(14)

The PT-100 changes linearly from $100\ \Omega$ at 0°C to $146.07\ \Omega$ at 120°C . If desired, choose a suitable compensating resistor (R_{COMP}) so that VIN can be virtually 0 V at any desirable temperature. For example, if $R_{COMP} = 100\ \Omega$, then at 0°C , $VIN = 0\text{ V}$ and thus a higher gain can be used.

The advantage of this circuit is its ratiometric configuration, where $V_{REF} = (IB1 + IB2) \times (R_{REF})$. Equation 15 shows that a ratiometric configuration eliminates $IB1$ and $IB2$ from the output equation, thus increasing the overall performance.

$$ADC_DOUT = \frac{VIN(Gain)}{2V_{REF}} (2^n)$$

$$ADC_DOUT = \frac{[IB1(RTD - R_{COMP})Gain]}{2(IB1+IB2)R_{REF}} (2^n)$$

$$ADC_DOUT = \frac{[(RTD - R_{COMP})Gain]}{2(2)R_{REF}} (2^n)$$

ADC_DOUT Showing IB1 & IB2 Elimination

(15)

10.2.1.3 Application Curve

Figure 73. PT-100 RTD Resistance from -200°C to 850°C

Typical Applications (continued)

10.2.2 3-Wire RTD

Figure 74. Topology #1: 3-Wire RTD using 2 Current Sources

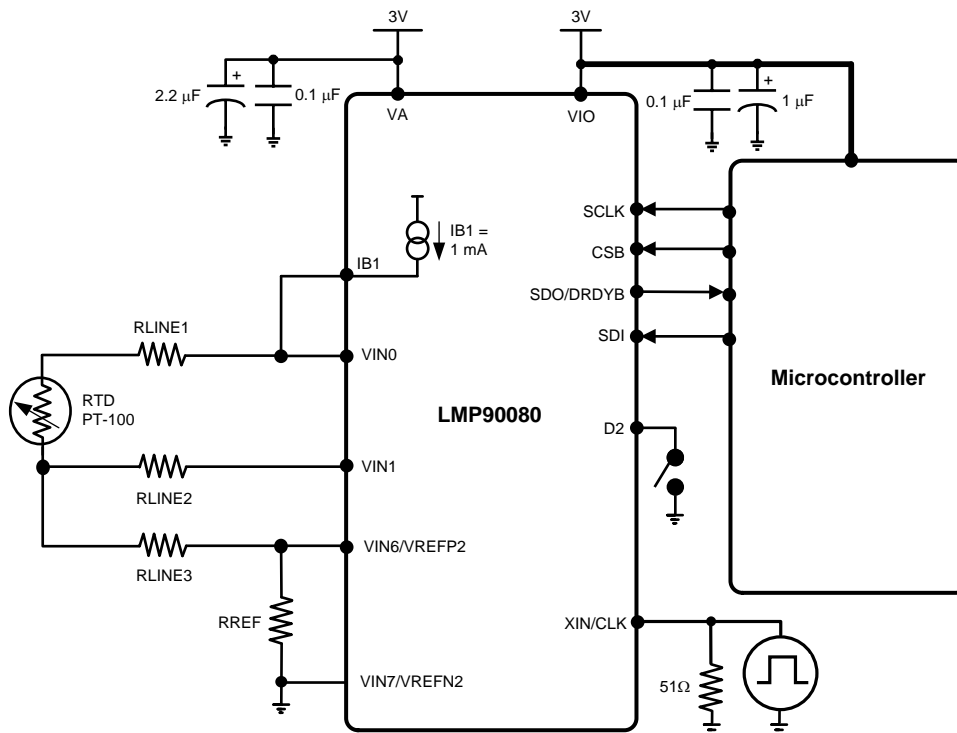

Figure 75. Topology #2: 3-Wire RTD using 1 Current Source

Typical Applications (continued)

10.2.2.1 Design Requirements

- VA = 3V
- VIO = 3V
- 3-Wire RTD using 1 current source

10.2.2.2 Detailed Design Procedure

Figure 75 shows the second topology for a 3-Wire RTD application. Topology #2 shows the same connection as topology #1, but without IB2. Although this topology eliminates a current source, it requires two channel measurements as shown in Equation 16.

$$VIN0 = IB1 (RLINE1 + RTD + RLINE3 + RREF)$$

$$VIN1 = IB1 (RLINE3 + RREF)$$

$$VIN6 = IB1 (RREF)$$

$$CH0 = VIN0 - VIN1 = IB1 (RLINE1 + RTD)$$

$$CH1 = VIN1 - VIN6 = IB1 (RLINE3)$$

Assume RLINE1 = RLINE3, thus:

$$CH0 - CH1 = IB1 (RTD)$$

VIN Equation for Topology #2

(16)

10.2.3 Thermocouple and IC Analog Temperature

Figure 77. Thermocouple with CJC

10.2.3.1 Design Requirements

- VA = 5V
- VIO = 2.7V
- Thermocouple with Cold Junction Compensation

10.2.3.2 Detailed Design Procedure

The LMP900xx is also ideal for thermocouple temperature applications. Thermocouples have several advantages that make them popular in many industrial and medical applications. Compare to RTDs, thermistors, and IC sensors, thermocouples are the most rugged, least expensive, and can operate over the largest temperature range.

A thermocouple is a sensor whose junction generates a differential voltage, VIN, that is relative to the temperature difference ($T_{hot} - T_{cold}$). T_{hot} is also known as the measuring junction or “hot” junction, which is placed at the measured environment. T_{cold} is also known as the reference or “cold” junction, which is placed at the measuring system environment.

Because a thermocouple can only measure a temperature difference, it does not have the ability to measure absolute temperature. To determine the absolute temperature of the measured environment (T_{hot}), a technique known as cold junction compensation (CJC) must be used.

In a CJC technique, the “cold” junction temperature, T_{cold} , is sensed by using an IC temperature sensor, such as the LM94022. The temperature sensor should be placed within close proximity of the reference junction and should have an isothermal connection to the board to minimize any potential temperature gradients.

Typical Applications (continued)

Once T_{cold} is obtained, use a standard thermocouple look-up-table to find its equivalent voltage. Next, measure the differential thermocouple voltage and add the equivalent cold junction voltage. Lastly, convert the resulting voltage to temperature using a standard thermocouple look-up-table.

For example, assume $T_{cold} = 20^{\circ}C$. The equivalent voltage from a type K thermocouple look-up-table is 0.798 mV. Next, add the measured differential thermocouple voltage to the T_{cold} equivalent voltage. For example, if the thermocouple voltage is 4.096 mV, the total would be $0.798\text{ mV} + 4.096\text{ mV} = 4.894\text{ mV}$. Referring to the type K thermocouple table gives a temperature of $119.37^{\circ}C$ for 4.894 mV.

10.2.3.3 Application Curve

Figure 78. Thermocouple Output as Function of Temperature

11 Power Supply Recommendations

The device can be placed in Active, Power-Down, or Stand-By state.

In Power-Down, the ADC is not converting data, contents of the registers are unaffected, and there is a drastic power reduction. In Stand-By, the ADC is not converting data, but the power is only slightly reduced so that the device can quickly transition into the active state if desired.

These states can be selected using the PWRCN register. When written, PWRCN brings the device into the Active, Power-Down, or Stand-By state. When read, PWRCN indicates the state of the device.

The read value would confirm the write value after a small latency (approximately 15 μ s with the internal CLK). It may be appropriate to wait for this latency to confirm the state change. Requests not adhering to this latency requirement may be rejected.

It is not possible to make a direct transition from the power-down state to the stand-by state. This state diagram is shown below.

Figure 79. Active, Power-Down, Stand-By State Diagram

12 Layout

12.1 Layout Guidelines

- Follow the guidelines in the [Power Supply Recommendations](#) section.
- Keep analog traces away from digital traces.
- Never run an analog and digital trace parallel to each other.
- If a digital and analog trace need to cross each other cross them at a 90° angle.
- Use a solid ground plane under the device.

12.2 Layout Example

Figure 80. LMP90xx Sample Layout

13 Device and Documentation Support

13.1 Device Support

13.1.1 Device Nomenclature

COMMON MODE REJECTION RATIO is a measure of how well in-phase signals common to both input pins are rejected. To calculate CMRR, the change in output offset is measured while the common mode input voltage is changed.

$$\text{CMRR} = 20 \text{ LOG}(\Delta\text{Common Input} / \Delta\text{Output Offset})$$

EFFECTIVE NUMBER OF BITS (ENOB, or EFFECTIVE BITS) – says that the converter is equivalent to a perfect ADC of this (ENOB) number of bits. LMP90080's ENOB is a DC ENOB spec, not the dynamic ENOB that is measured using FFT and SINAD. Its equation is as follows:

$$\text{ENOB} = \log_2 \left(\frac{2 \times \text{VREF}/\text{Gain}}{\text{RMS Noise}} \right) \quad (17)$$

GAIN ERROR is the deviation from the ideal slope of the transfer function.

INTEGRAL NON-LINEARITY (INL) is a measure of the deviation of each individual code from a straight line through the input to output transfer function. The deviation of any given code from this straight line is measured from the center of that code value. The end point fit method is used. INL for this product is specified over a limited range, per the Electrical Tables.

NEGATIVE FULL-SCALE ERROR is the difference between the differential input voltage at which the output code transitions to negative full scale and $(-\text{VREF} + 1\text{LSB})$.

NEGATIVE GAIN ERROR is the difference between the negative full-scale error and the offset error divided by $(\text{VREF} / \text{Gain})$.

NOISE FREE RESOLUTION is a method of specifying the number of bits for a converter with noise.

$$\text{NFR} = \log_2 \left(\frac{2 \times \text{VREF}/\text{Gain}}{\text{Peak-to-Peak Noise}} \right) \quad (18)$$

ODR Output Data Rate.

OFFSET ERROR is the difference between the differential input voltage at which the output code transitions from code 0000h to 0001h and 1 LSB.

POSITIVE FULL-SCALE ERROR is the difference between the differential input voltage at which the output code transitions to positive full scale and $(\text{VREF} - 1\text{LSB})$.

POSITIVE GAIN ERROR is the difference between the positive full-scale error and the offset error divided by $(\text{VREF} / \text{Gain})$.

POWER SUPPLY REJECTION RATIO (PSRR) is a measure of how well a change in the analog supply voltage is rejected. PSRR is calculated from the ratio of the change in offset error for a given change in supply voltage, expressed in dB.

$$\text{PSRR} = 20 \text{ LOG} (\Delta\text{VA} / \Delta\text{Output Offset})$$

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
